

ORDNANCE OFFICE,

WASHINGTON, October 14, 1847.

Captain A. MORDECAI,
Washington Arsenal.

SIR: The duty of arranging, preparing, and publishing drawings of a uniform system of Artillery, and of revising the Ordnance Manual and publishing a new edition, is assigned to you. * * * * *

G. TALCOTT, *Lt. Col. of Ordnance.*

ORDNANCE BOARD.

WASHINGTON, November 15, 1849.

To Brig. Gen. TALCOTT,
Col. of Ordnance.

SIR: Under your instructions of the 27th ult., the Ordnance Board have carefully examined the Ordnance Manual, as revised by Major A. Mordecai for a new edition, in pursuance of your order dated October 14, 1847, and have made such alterations and additions as appeared to be required preparatory to the publication of the work.

R. L. BAKER, *Brevet Lieut. Col.*
J. W. RIPLEY, *Brevet Lieut. Col.*
J. SYMINGTON, *Major of Ordnance*
A. MORDECAI, *Brevet Major.*
B. HUGER, *Brevet Col.* } ORD. BOARD.

ORDNANCE DEPARTMENT,

WASHINGTON, November 17th, 1849.

Hon. GEO. W. CRAWFORD,
Secretary of War.

It is respectfully recommended that the revised edition of the Ordnance Manual be printed for the use of the Army.

G. TALCOTT, *Bvt. Brig. Gen.,*
Colonel of Ordnance.

Approved, November 23, 1849:

G. W. CRAWFORD.

EXTRACTS from the preface to the first edition of the *Ordnance Manual*.

"This work being designed chiefly for the use of those charged with the fabrication and care of the *materiel*, leaves untouched nearly all that relates to the personal service of Artillery, either in the field or in garrison." * * *

"It is earnestly requested that all officers of the Army, and especially those of the Ordnance Department, will avail themselves of every opportunity to verify the details and add to the information here given, and that they will communicate to the Colonel of Ordnance any corrections or amendments which it may appear advisable to make in a future edition of the work."

Ammunition - - - - -	17
Ammunition Chests - - - - -	18
Knots - - - - -	19

INDEX.

A.

- ACCOUTREMENTS.** Infantry, 201—Rifle, 202—Cavalry, 203—Artillery, 204—Sappers, 204—Spare parts for repairs, 205—Materials for making, 205—Weights, 207.
- AIR**, atmospheric: Density, 410, 431.
- ALLOYS**, of various metals, 393—Of coins, 418.
- AMMUNITION: Chap. X.**—*For Field Service*: Preparation, 250; dimensions and weights, 259; packing, 260; quantity and weight in each ammunition chest, 303; on each carriage, 306; for a field battery, 330; for field train, 329—*For Mountain Howitzer*, 136—*For Siege and Garrison Service*: Preparation, 262; quantity for siege train, 333; for armament of forts, 337—Storage of ammunition, 296—Breaking up, 297.
- AMMUNITION CHESTS:** *For Field Carriages*: Nomenclature, 39; bill of timber, 67; bill of iron, 82; dimensions and weight, 57; interior arrangement, 299, 302; contents, 303; weights, packed, 306—*For Mountain Howitzer*: Nomenclature and contents, 139; materials for, 146, 148; dimensions and weights, 145; contain 700 musket cartridges, 331; number for a battery, 331.
- ANGLE OF SIGHT**, natural: Definition, 3—Of guns, 5—Of columbiads and howitzers, 6.
- ANIMAL POWER**, 419.
- ANTHRACITE COAL**, 397.
- AREAS**: Of plane and curved surfaces, 435—Of circles, 443, 452.
- ARITHMETICAL PROGRESSION**, 439.
- ARMAMENT OF FORTIFICATIONS**, 337.
- ARMORER'S TOOLS**: For arsenals, 192—For the field park, 325.
- ARMS**, small: **Chap. VIII.**—Nomenclature, 157—Dimensions and weights, 163. Inspection of new arms, 164—Browning, 180—Packing, 181—Preservation in store, 184—Issuing, 185—Preservation in service, 185—Inspection of arms in service, 189—Repairs, 190—*Side Arms*: Nomenclature, 198; dimensions and weights, 199; spare parts for repairs, 205.
- ARTILLERY**: see **ORDNANCE**—Carriages, **Chap. III**—Proportion of artillery for a field train, 329—For siege train, 332—For armament of forts, 337, 341—For mountain service, **Chap. VI**.
- ARTILLERY PRACTICE: Chap. XIII.**

B.

- BABBIT'S METAL**; composition of, 393.
- BALANCE**, for weighing, 434.
- BALLISTICS**, 428.
- BALLS**: *Lead*: Diameters and weights, 29; manner of making, 244; penetration, 373—*Cast Iron*: Diameter and weight, 27 to 30; specific gravity, 30; computation of weight, 30; inspection, 30; piling, 32; table of piles, 34; penetration, 368.
- BAR IRON**: Manufacture, 382—Properties, 384—Tables of weight, 404.
- BARBETTE CARRIAGES**: Nomenclature, 47—Dimensions and weights, 58—Bills of timber, 71—Bills of iron, 90—Implements and equipments, 339—Mechanical manœuvres, 352.
- BAROMETER**: Measurement of heights, 426.
- BARRELS**: Of small arms; dimensions and weights, 163; inspection, 169—For gunpowder, 218.
- BASKET**, for mortar service, 115.
- BATTERY**, of field artillery: Composition of, 330—Ammunition, 330—Mountain howitzer, 331.
- BATTERY WAGON**: Nomenclature, 42—Dimensions and weight, 57—Bill of timber, 69—Bill of iron, 85—Equipment for field battery, 310—Equipment for field park, 319—Weights, packed, 323.
- BAYONET**: Nomenclature, 157—Length and weight, 163.
- BEAMS**: Strength of, 400.
- BELL METAL**: Composition of, 393.
- BILL HOOK**, 117.
- BILLS**: Of timber, for artillery carriages, 67—Of iron, 76.
- BITUMINOUS COAL**, 397.
- BLOCKS**: For cartridges, for field howitzers, 252—For sea-coast howitzers, 263—For mechanical manœuvres, 344.
- BLUE LIGHTS**, 295.
- BOARDS**: Measurement of, 381.
- BOILING POINTS**, of liquids, 424.
- BOLTS**: Classification and table of dimensions, 62, 63.
- BOOKS**: For siege equipment, 336—Of reference, 472.
- BOXES**: For packing small arms, 181—For lead balls, 245—For percussion cartridges, 249—For packing field ammunition, 260.
- BRASS**: Composition of, 393.
- BRONZE**: Composition and analysis, 8—Strength, 402.
- BROOM**, for mortar batteries, 115.
- BROWNING ARMS**: Instructions for, 180.
- BUCKSHOT**: Size of, 243.

BUDGE BARREL, 110.

BURNS: Liniment for, 298.

C.

CAISSON: Nomenclature, 39—Dimensions and weight, 57—Bill of timber, 68—Bill of iron, 82—Equipment for field, 305—Weight, equipped, 306—Number of rounds of ammunition, 306—Number, with a field battery, 330.

CANISTER SHOT: Dimensions and weights, 29.

CANISTERS: For field service, 255—For siege and garrison, 265.

CANNON: See ORDNANCE—For siege train, 332.

CANNON LOCK, 113.

CAPS: Percussion, for small arms, 278—Paper, for cartridges, 257.

CARBINE: Hall's, 162, 163—Care of, 177.

CARCASSES: Dimensions and weights, 28—Manner of loading, 291.

CARRIAGES: **Chap. III.**—*Nomenclature*: Field, 37; siege, 44; barbette, 47; casemate, 49—*Dimensions and Weights*: Field, 55, 57; siege, 56, 57; barbette, 58; casemate, 60—*Bills of Timber*: Field, 67; siege, 70; barbette, 71; casemate, 73—*Bills of Iron*: Field, 76; siege, 86; barbette, 90; casemate, 95—Number for a field battery, 330—For a siege train, 332—For armament of forts, 337.

CARRIAGE MAKER'S TOOLS: For equipment of mountain howitzer, 144—For field battery wagon, 311—For park battery wagon, 320.

CARTRIDGES: *For Small Arms*: Charges, 243; making, 245; dimensions of bundles, 248; manner of packing, 249—For field service, 250—For siege and garrison service, 262.

CARTRIDGE BAGS: Field, 250—Siege and garrison, 262—Paper, 263—For hot shot, 264, 374—For proving ordnance, 264.

CARTRIDGE BLOCKS: For field howitzers, 252—For sea-coast howitzers, 263.

CASEHARDENING, iron, 390.

CASEMATE CARRIAGES: Nomenclature, 49—Dimensions and weights, 60—Bills of timber, 73—Bills of iron, 95—Equipment, 339—Mechanical manœuvres, 353.

CASK GAUGING, 438.

CAST IRON: For guns, 9—Properties, 385—Strength, 402.

CAVALRY: Musketoon, 160—Sabre, 198—Accoutrements, 203.

CENTRES OF GRAVITY, 438.

CHAINS: Classification, 66—Strength and weight, 402.

CHARGES: For proving ordnance, 17—For small arms, 243—For field service, 250—For siege and garrison service, 263—For field shells, 255—For mortar shells, 267—For columbiad shells, 268—For spherical case shot, 255.

CHASSIS: See *Barbette* and *Casemate* Carriages.

CHOCKS: For casemate carriage, 115—For mechanical manœuvres, 344.

- CIRCLES** : Tables of areas and circumferences, 443-452.
CIRCULAR SEGMENTS : Table of areas, 451.
COAL : Charcoal, 395—Bituminous, 397—Anthracite, 397.
COAL TAR, 397—For lacker, 153.
COEHORN MORTAR : Dimensions and weight, 7—Bed, 51.
COINS : Weight and alloy, 418—United States and Foreign coins, 418.
COKE, 397.
COLUMBIADS : Dimensions and weights, 6—Proof, 17—Cartridges, 263.
COLUMNS : Strength of, 400.
COMBUSTIBLES : Heating power of, 424.
CONDUCTORS : Lightning, 225—Of electricity, 420.
CONGREVE ROCKETS, 289.
COPPER : Properties of, 8—Tinning, 391—Strength, 399, 402.
CUBES : Table of, 452.
CYLINDERS : Strength of hollow iron, 401.

D.

- DISPART** : Definition of, 4—Of guns, 5—Of howitzers, 6.
DRAG ROPE, 117.
DRAWING PAPER : Dimensions of, 418.

E.

- ELECTRICITY** : Conductors of, 420.
EMBRASURE SHUTTERS, 335.
ÉPROUVETTE : Dimensions and weight, 7—Bed, 51—Use of, 220.
EQUIPMENT : **Chap. XI.**—Of field carriages, 305—Of forge for field battery, 307—Of battery wagon for field battery, 310—Of park forge, 316—Of park battery wagon, 319—Of field train, 329—Of siege train, 332—Of fortress carriages, 339—Of mortar batteries, 339.
EXPANSION : Of shot, by heat, 375—Of various bodies, by heat, 422.
EYE PINS : Dimensions of, 66.

F.

- FALLING BODIES** : Motion of, 427.
FASCINES : Preparation of pitched fascines, 294.
FELLING AXE : Dimensions, 117—Weight, 118.
FIELD CARRIAGES : Nomenclature, 37—Dimensions and weights, 55—Bills of timber, 67—Bills of iron, 76—Equipment 305.
FIELD PARK, 331.
FIELD TRAIN, 329.
FILES, 392.
FIRE BALLS, 292.
FIRE STONE, 289.

- FIRE WORKS, Chap. X.**—Materials, 236—Storage, 296.
- FIXED AMMUNITION:** For mountain howitzer, 138—For field service, 250.
- FLINTS,** 242—Number to 100 rounds, 329.
- FORAGE:** Weight of different kinds, 419.
- FORGE:** *For Field Service:* Nomenclature, 40; dimensions and weight, 57; bill of timber, 68; bill of iron, 83; for field battery, 307; for field park, 316; weights, equipped, 328—*For Mountain Service,* 140; weight of, 145.
- FRACTIONS:** Table of equivalent vulgar and decimal, 407.
- FREEZING POINTS,** of liquids, 424.
- FRICTION:** Laws of, 434.
- FRICTION PRIMERS:** Manner of making, 281.
- FRIGORIFIC MIXTURES,** 424.
- FULMINATE,** of mercury: Preparation of, 279.
- FUNNEL,** 115.
- FURNACES:** For laboratory, 230—For heating shot, 374.
- FUZES:** For mortar service, 274—For field service, 276—For columbiads and howitzers, 277.
- FUZE IMPLEMENTS,** 114—Weights of, 118.
- FUZE PLUGS:** For field shells, 254—For heavy ordnance, 268.

G.

- GAUGES:** For shot and shells, 27—For inspecting small arms, 164—For gunpowder, 219.
- GAUGING,** casks, 438.
- GEOMETRICAL PROGRESSION,** 439.
- GINS:** Nomenclature, 51—Dimensions and weights, 62—Bills of timber, 75—Bills of iron, 99—Mechanical manœuvres, 354.
- GIN FALL:** Field and siege, 354—Garrison and casemate, 357.
- GOLD RAIN,** 288.
- GOMER CHAMBER,** 3.
- GRAPE SHOT:** Dimensions and weights, 29.
- GRAPE:** Stands of, 266.
- GRATES,** for heating shot, 374.
- GRAVITY:** Specific, 409—Force of, 427—Centres of, 438.
- GREASE,** for wheels, 155.
- GRENADERS,** 29.
- GROMMETS,** 269.
- GUNS:** Dimensions and weights, 5—Proof, 17, 18—Ranges, **Chap. XIII.**
- GUN METAL:** Bronze, 8—Cast iron, 9—Strength, 402.
- GUNNER'S IMPLEMENTS:** Gimlet, 111—Perpendicular, 113—Pincers, 114—Callipers, 114—Quadrant, 114—Sleeves, 115—Weights of, 118.

- GUN CARRIAGES:** *Field:* Nomenclature, 37; dimensions and weights, 55; bills of timber, 67; bills of iron, 76; equipment, 305; weights, equipped, 306—*Siege:* Nomenclature, 44; dimensions and weights, 56; bills of timber, 70; bills of iron, 86; equipment, 334—*Barbette:* Nomenclature, 47; dimensions and weights, 58; bills of timber, 71; bills of iron, 90; equipment, 339—*Casemate:* Nomenclature, 49; dimensions and weights, 60; bills of timber, 73; bills of iron, 95; equipment, 339—*For Mountain Howitzer:* Nomenclature, 131; dimensions and weights, 145.
- GUNPOWDER:** **Chap. IX.**—Materials, 209—Proportions, 213—Manufacture, 214—Density, 217—Packing, 218—Inspection and proof, 219—Analysis, 223—Preservation and storage, 224—Temperature at which it explodes, 217.

H.

- HALE'S ROCKETS,** 289—Ranges and weights, 365.
- HALL'S CARBINE:** Nomenclature, 162—Dimensions and weight, 163—Inspection, 177—Care of, 188.
- HAND BILL,** (or bill hook,) 117.
- HAND CART:** Nomenclature, 53.
- HANDSPIKES:** For field, siege, and garrison service, 109—Number required, see **EQUIPMENT.**
- HARNESS:** For *Field and Siege Carriages*, **Chap. V.**—Weight, 127; dimensions of parts, and buckles, 128; materials for making, 130; storage, 130; spare parts for repairs, 315, 323—For a battery, 330—For *Mountain Service*, 134.
- HAUSSE:** Pendulum, for field service, 112.
- HAVRESACK,** 110.
- HAY:** Weight in bundles, 419.
- HEAT:** Properties and effects, 420 to 425.
- HEIGHTS:** Barometric measurement of, 426.
- HORSES:** Number required for a field battery, 330—For siege train, 332—Power of, 419—Steam horse power, 420.
- HORSE SHOES,** and nails: Weight of, 310.
- HOT SHOT:** Firing, 374—Expansion, 375.
- HOWITZERS:** Dimensions and weights, 6—Proof, 18—Shells, 27—*Ammunition:* For mountain, 136; for field, 250; for siege and garrison, 263.

I.

- ICE:** Strength of, 425.
- IMPLEMENTS:** For *Field, Siege, and Garrison Service*; **Chap. IV.**—Nomenclature and dimensions, 103; weights, 108, 118; storage, 119—For *Mountain Artillery*, 132, 139—*Kind and number:* For field carriages, 305; for siege carriages, 334; for fortress carriages, 339; for firing hot shot, 374; for mechanical manœuvres, 344—For *small arms*, 158, 162.

- INCENDIARY MATCH**: Preparation of, 295.
- INCLINED PLANE**: Power of, 433.
- INFANTRY ACCOUTREMENTS**, 201.
- INITIAL VELOCITIES**: Of cannon balls, 365—Of bullets, 367—Formula for computing, 432.
- INSPECTION**: Of ordnance, 12—Of shot and shells, 30—Of small arms, new, 164—Of arms in service, 189—Of Hall's carbine, 177—General directions for inspection of arms, 179.
- INSTRUMENTS**: For inspecting ordnance, 10—For siege train, 336—For armament of forts, 341.
- IRON, CAST**: For guns, 9, 10—Specific gravity and strength, 9, 399, 402—Properties and varieties, 385.
- IRON, BAR**: Bills, for field carriages, 76—For siege carriages, 86—For barbette carriages, 90—For casemate carriages, 95—For mountain howitzer carriage, &c, 147, 148—Manufacture, 382—Properties and test, 384—Forging, 385—Tinning, 391—Strength, 399, 402—Weight, tables of, 404—Plate, weight of, 406, 407—Wire gauge, 66.
- IRON PIPES**: Weight of, 408.
- ISSUE OF ARMS**, 185.

J.

- JACK**: Lifting, 54—Lever, 54—Small screw jack, 118.

K.

- KIT**: Composition, 295.
- KNOTS**: *Plate* 19.

L.

- LABORATORY**: Arrangement, fixtures and furniture, 229—Tools, 231—Materials, 236—Paper, 239.
- LACKER**: For iron ordnance, 152—For small arms and paper, 153—For iron work, 154.
- LADLES**: For cannon, 105—Number required, 334, 339.
- LEAD**: Detection of, in bronze, 8—Adulteration of, 237—To reduce oxide, 237—Temperature of melting point, 423.
- LEAD BALLS**: Diameters and weights, 29—To compute weight of, 30—Fabrication, 244—Pressed, 245—Packing, 245.
- LEADERS**, 271.
- LEATHER**: For artillery harness, 130—For accoutrements, 205.
- LEG GUARD**: Description, 125—Weight, 127.
- LEVER JACK**, 54.
- LEVER**: Power of, 432.
- LIFTING JACK**: Nomenclature and weight, 54.
- LIGHT BALLS**, 294.

- LIGHTNING RODS**, 225.
- LIMBER**: *For Field Carriages*: Nomenclature, 38; dimensions and weight, 55; bill of timber, 67; bill of iron, 81—*For Siege Carriages*: Nomenclature, 45; dimensions and weight, 56; bill of timber, 70; bill of iron, 88.
- LINE OF SIGHT**, natural, 3.
- LINIMENT**, for burns, 298.
- LINSTOCK**: Description, 110—Weight, 118.
- LOCK**: *For Cannon*: Description 113; weight, 118—*For Small Arms*: Nomenclature, 157; weight, 163; inspection, 172.
- LOCK COVER**, 113—Weight, 118.
- LOGARITHMS**, 440.
- M.**
- MACHINES**: Nomenclature, 51—Required for siege service, 335—*For garrison service*, 340.
- MAGAZINES**: *For gunpowder*, 224.
- MAGNETIC NEEDLE**: Variation and dip, 426.
- MARKS**: Of ordnance, 19—Of small arms, 180.
- MARRONS**, 289.
- MATCH**: Preparation of, 269, 270—Incendiary, 295.
- MATERIALS**: *For constructions*, **Chap. XIV**—*For repairing siege carriages*, 335—*For repairing fortress carriages*, 340—Strength and weight, 399 to 410.
- MATHEMATICAL** formulæ and data, 435.
- MAUL**, 115.
- MEASURES**, U. S. and Foreign: Length, 411—Surface, 414—Solidity, 414—Capacity, 415—Weight, 416—Value, 418.
- MEASUREMENT**, of timber and boards, 381.
- MECHANICAL MANŒUVRES**: Field artillery, 343—Siege artillery, 344—Mortar wagon, 349—Garrison artillery, 352—Gin, 354.
- MECHANICAL POWERS**, 432.
- MELTING POINTS**, of solids, 423.
- MEN**: Working power, &c., 419.
- MEN'S HARNESS**: Description, 117—Weight, 118.
- MENSURATION**, 435.
- METALS**: *For constructions*, 382—Storage and preservation, 393—Relative ductility and malleability, 399—Strength and weight, 399 to 406—Expansion, by heat, 422.
- METRES**: Table for reduction to inches, 413.
- MONEY**, 418.
- MORTARS**: Dimensions and weights, 7—Proof, 18, 19—Beds, 50, 57—Platform, 51, 57—Implements and equipments, **Chap. IV**; 339—Mechanical manœuvres, 350.

- MORTAR WAGON**: Nomenclature, 46—Dimensions and weight, 57—Bill of timber, 70—Bill of iron, 89—Mechanical manœuvres, 349.
- MOUNTAIN ARTILLERY**, **Chap. VI.**—Dimensions and weight of howitzer, 6—Of carriages and equipment, 145—Ranges of howitzer, 148—Composition of a battery, 331.
- MUSKET**: Nomenclature of percussion, 157—Flint, 159—Alteration of flint to percussion, 159—Dimensions and weights, 163—Inspection, 164—Packing, 181—Strength of barrels, 196.
- MUSKETOON**: Cavalry, 160—Artillery and Sappers, 161—Dimensions and weights, 163.

N.

- NAILS**: *Wrought and Cut*: Dimensions and weights, 64—*Horse Shoe*, 310.
- NEEDLE**, magnetic: Declination and dip, 426.
- NOSE BAG**, 125.
- NUTS**: Classification and dimensions, 63.

O.

- OATS**: Weight of a bushel, 419.
- ORDNANCE**: Kinds and calibres, 1—Nomenclature, 2—Designation, 4—Inspection, 10—Proof, 16—Marks, 19—Injuries in service, 19—Spiking and unspiking, 20—Preservation, 21—Table of foreign ordnance, 23—Proportion for a field train, 329—For a siege train, 332.

P.

- PACKS**, for mountain service, 146.
- PACK SADDLE**: Nomenclature, 133—Weight, 145—Bill of timber, 146—Bill of iron, 148.
- PACKING**: Small arms, 181—Fixed ammunition, 260.
- PACKING BOXES**: For muskets, 181—For rifles and pistols, 183—For balls, 245—For percussion cartridges, 249—For fixed ammunition, 260—For percussion caps, 281—For field forge, 307—For field battery wagon, 311, 313—For park forge, 316—For park battery wagon, 319, 322.
- PAINT**: Preparation, **Chap. VII.**—Quantity and kind required for a carriage, 151—For tarpaulins, 151—Brainard's, 151.
- PAPER**: For laboratory purposes, 239—For small arm cartridges, 245—For field ammunition, 257—Cartridge bags, 263—Drawing, dimensions of, 418.
- PARK**: Field, composition of, 331.
- PASS BOX**, 110.
- PASTE**, 240.
- PENDULUM HAUSSE**: Construction of, 112.
- PENDULUM**, ballistic: Used for proving powder, 221.
- PENDULUMS**: Length for a given time of vibration, 427.

- PENETRATION** of balls: In masonry, 368, 372—In wool, 369, 372, 373—In earth, 370—In fascines and wood, 371—In cast iron, 372—In paper, 373.
- PERCUSSION CAPS**, for small arms: Manufacture, 278—Number required for cartridges, 248, 329.
- PERCUSSION PRIMERS**, for cannon: Manufacture, 283—Number required for field ammunition, 303.
- PEWTER**: Composition, 393—Melting point, 422.
- PICK AXE**, 117—Weight, 118.
- PILING BALLS**, 33—Table of piles, 34.
- PIPES**: Weight of iron, 408.
- PISTOL**: Nomenclature, 161—Dimensions and weight, 163—Proof, 169—Packing, 183.
- PITCH**: Manner of making, 398.
- PITCHED FASCINES**: Preparation of, 294.
- PLATFORM**: For mortars, 51, 57—For siege guns, number required, 335.
- PLUMMET**, for mortar service, 115.
- POINTING WIRE**, for mortars, 115.
- PORT FIRES**: Manner of making, 273—Number required for field service, 303.
- PORTFIRE CASE**, 110—Weight, 118.
- PORTFIRE STOCK**, 110—Weight, 118.
- PORTFIRE CUTTER**, 111—Weight, 118.
- POWDER**: See **GUNPOWDER**.
- POWDER MEASURES**: Dimensions of, 115, 116.
- POWERS**, of numbers, 452.
- PREPONDERANCE** of cannon: Definition, 4—Of guns, 5—Of columbiads and howitzers, 6.
- PRIMERS** for cannon: Friction, 281—Percussion, 283—Number required, for field ammunition, 303; for siege, 333; for forts, 338.
- PRIMING HORN**, 111—Weight, 118.
- PRIMING WIRE**, 111.
- PRIMING TUBES**: Manufacture, 271—Number required, 303, 333, 338.
- PROGRESSION**: Arithmetical and geometrical, 439.
- PROJECTILES**: See **SHOT AND SHELLS**; **BALLISTICS**.
- PROLONGE**: For *Field Service*: Description, 116; weight, 118—For *Mechanical Manœuvres*, 345.
- PROOF**: Of Iron for ordnance, 10—Of ordnance, 16—Of shot, 31—Of small arms, 169—Of swords and sabres, 199—Of gunpowder, 219—Of chains, 66, 402.
- PULLEY**: Power of, 432.
- PULLEY BLOCKS**, for gins, 51, 52.
- PYROMETER**: Wedgewood's, 420.

Q.

QUICK MATCH, 270.

QUOIN for mortar beds, 115—Weight, 118.

R.

RACKS, for small arms, 184.

RAIN: Quantity that falls annually, 426—Of fire, 288—Gold, 288.

RAMMERS: Heads, 103—Staves, 107—Finished, 108.

RANGES of ordnance: Mountain howitzer, 148—Field guns and howitzers, 359, 360—Siege and garrison guns and howitzers, 361—Columbiads, 363—Mortars, 364—War rockets, 365.

RASPS: Kinds and sizes, 392.

RED HEAT of iron, 423.

REPAIRS: Of small arms, 190 to 196—Of side arms and accoutrements, 205.

RESISTANCE of the air, to motion of projectiles, 431.

RIFLE: Nomenclature, 160—Dimensions and weight, 163—Inspection and proof, 166, 169—Accoutrements, 202.

RINGS, for chains: Dimensions, 65.

RIVETS: Dimensions and forms, 64.

ROCKETS: Signal, 284—War, 289—Ranges and weights of Hale's, 365.

ROPES: For siege train, 335—For forts, 340—For mechanical manœuvres, 345—Quality and kinds, 394—Splicing, 394—Strength and weight, 403.

S.

SABOTS: For mountain howitzer ammunition, 136—For field ammunition, 252—For heavy shells, 264.

SABRES: Cavalry and artillery, 198.

SADDLE: For field artillery harness, 123, 127—Pack, 133, 145.

SAPPER'S: Musketoon, 161, 163—Accoutrements, 204.

SCRAPER, for shells, 115.

SCREW: Mechanical power, 433—Table of wood screws, 65.

SCREW JACK, 118.

SEGMENTS, of circles: Table of areas, 451.

SERPENTS, for rockets, 288.

SHEET METALS: Gauge, 66—Weight, 407.

SHEET IRON: Properties, 390—Weight, 406, 407.

SHEET TIN, 391.

SHELLS: Dimensions and weights, 27—To compute weight of, 30—To find the quantity of powder to fill a shell, 30—Inspection, 30—*Strapping*: For mountain howitzer, 136; for field service, 253; for siege and garrison cannon, 264—*Charging*: For mountain howitzer, 137; for field service, 255; for mortars, 267; for heavy ordnance, 268—Unloading, 298—Ranges, 148, 360, 365—Penetrations, 369 to 372.

SHELL HOOKS, 115.

SHELL PLUG SCREW, 114.

SHOT: Dimensions and weights, 27—To compute weight of, 30—Inspection, 30—Piling and preservation, 32—Ranges, 359 to 363—Penetrations, 368 to 372—Expansion by heat, 375.

SHOVEL: Dimensions, 117—Weight, 118.

SIEGE ARTILLERY: *Ordnance*: Kinds, 1; dimensions and weights, 5, 6, 7; proportions, in a siege train, 332—*Carriages*: Nomenclature, 44—dimensions and weights, 56; bills of timber, 70; bills of iron, 86.—Equipment, 332—Mechanical manœuvres, 344.

SIEGE TRAIN, 332.

SINES: Table of natural sines and tangents, 441.

SLING: For guns, 356.

SLING CARTS: Nomenclature, 52—Dimensions and weights, 62—Bill of timber, 75—Bill of iron, 101—Mechanical manœuvres, 351.

SLOW MATCH: Preparation, 269—Quantity for field ammunition, 303—For siege train, 333—For forts, 338.

SMALL ARMS, **Chap. VIII**—Nomenclature, 157—Dimensions and weights, 163—Inspection, 164—Packing, 181—Storage, 184—Repairs, 190—Ammunition, 243—For armament of forts, 338.

SNOW: Limits of perpetual snow, 426.

SOLDER: Composition, 393—Melting points, 423.

SOLDERING, 391.

SOUND: Velocity, 425.

SPARE PARTS, for repairs: Small arms, 193—Side arms and accoutrements, 205—Field carriages and equipments, 331; see also **EQUIPMENT**—Siege carriages, 335—Fortress carriages, 340.

SPATULA, for mortar service, 115.

SPECIFIC GRAVITIES: Tables of, 409, 410.

SPHERICAL CASE SHOT: Dimensions and weights, 25—Inspection, 30—*For Mountain Howitzer*: Fixing and charging, 137—*For Field Service*: Charge for firing, 250; strapping, 253; charging, 255; weights, fixed, 259; packing 260; proportion for a battery, 330; ranges, 359; initial velocities, 365—*For Siege Service*: Charging, 255; strapping, 264; proportion for siege train, 333—Fuzes, 276.

SPIKING ordnance, 20.

SPLICING ropes, 394.

SPLINTS for mortar service, 115.

SPONGES, 104—Heads, 104—Covers, 105—Staves, 106—Weights, 108, 118.

SPONGE BUCKET: Description, 116—Weight, 118.

SQUARES and roots, of numbers, 452.

- STARS**, for rockets, 287.
- STAVES**, for implements: Dimensions, 106—Bill of plank, 108.
- STEAM**: Elastic force, 425—Horse power, 420.
- STEEL**: Kinds and properties, 387—Hardening and tempering, 389—Strength, 399, 402.
- STONE MORTAR**: Dimensions and weight, 7—Proof, 18—Charge, 333.
- STORE TRUCK**: Nomenclature, 53—Weight 54.
- STRAPS**, for shot and shells: Field, 253—Siege and garrison, 264.
- STRAPPING** shot and shells: For mountain howitzer, 136—For field service, 253, 255—For siege and garrison service, 264.
- STRENGTH**: Of iron for guns, 9—Of musket barrels, 196—Of materials, 399, 402—Of chains, 402—Of hemp and iron wire ropes, 403—Of ice, 425.
- SWORDS** and sabres: Nomenclature, 198—Dimensions and weights, 199—Inspection and proof, 199—Packing, 200—Cleaning 201.

T.

- TABLES**: United States ordnance, 5, 6, 7—Foreign ordnance, 23—Shot and shells, 27—Lead balls, 29—Cast iron balls, 30—Piles of balls, 34—Dimensions and weights of artillery carriages, 55 to 62—Bolts and nuts, 63—Wood screws, 65—Finished implements, 108, 118—Dimensions of parts of harness, 128—Small arms, 163—Fixed ammunition, 259—Ranges of mountain howitzer, 148—Ranges of field guns and howitzers, 359—Ranges of heavy ordnance, 361—Ranges of Hale's rockets, 365—Initial velocities, 365—Board measure, 381—Files and rasps, 392—Weight of iron, 404 to 407—Equivalent vulgar and decimal fractions, 407—Cast iron pipes, 408—Specific gravities, 409—Weights and measures, 411 to 417—Coins, 418—Regular polygons, 436—Natural sines and tangents, 441—Circular segments, 451—Areas and circumferences of circles, 443, 452—Powers and roots of numbers, 452.
- TANGENTS**: Table of natural tangents, 441.
- TANGENT SCALES**: For field guns and howitzers, 111, 112.
- TAR**, 398.
- TAR BUCKET**: Description, 116—Weight, 118.
- TARPAULINS**: Dimensions, 115—Weights, 118—Painting, 151.
- TARRED LINKS**, 294.
- TENACITY**: Of gun iron, 9—Of various materials, 399, 402.
- TEST**: Of gun iron, 9, 10—Of saltpetre; rough, 209; refined 212—Of bar iron, 384—Of steel, 389—Of files, 392.
- THERMOMETERS**: Comparison of different scales, 420.
- THUMBSTALL**, 111.

- TIMBER**: For artillery carriages, 67 to 75—For implements, 109—For mountain howitzer carriage, &c., 146—For repairs of siege carriages, 335—For repairs of fortress carriages, 340—Kinds of trees, 377—Selection and felling, 378—Defects, 379—Seasoning and preserving, 379—Measuring, 381—Strength, 399, 400—Weight, 409.
- TIN**: Sheet, 391—Strength, 399—Weight, 409—Melting point, 423.
- TINNING**, iron and copper, 391.
- TOMPIONS**, for mortars and howitzers, 115.
- TOOLS**: For equipment of mountain artillery, 142, 144—Armorer's, for arsenals, 192—Laboratory, 231—For field forge, 308—For field battery wagon, 311—For park forge, 316—For park battery wagon, 320—For siege train, 336—For armament of forts, 340.
- TORCHES**: Preparation, 295.
- TORSION**: Resistance of bodies, 401.
- TOURTEAUX**, (tarred links,) 294.
- TOW HOOK**: Dimensions, 115—Weight, 118—Number required, 305.
- TRAJECTORY** of a ball: In vacuo, 428—In the air, 430.
- TRIGONOMETRY**: Formulæ, 440.
- TRUCKS**: Casemate, 53—Store, 53—Weights, 54.
- TUBES**, priming: Metal, 271—Quill, 272—Friction, 281.
- TUBE POUCH**: Description, 110—Weight, 118.
- U.
- UNSPIKING** cannon, 21.
- V.
- VALENCIENNES COMPOSITION**, 291.
- VALISE**: Artillery driver's, 124.
- VALUE** of foreign coins, 418.
- VARIATIONS** allowed: In iron ordnance, 14—In brass ordnance, 16.
- VARNISH**: For patent leather, 154—Copal, 154—Japan, 155—For percussion caps, 280.
- VEGETATION**: Limits of growth of various plants, 426.
- VELOCITIES**, initial: Of cannon balls, 365—Of lead balls, 367—Loss by windage, 367—Formula for computing, 432.
- VELOCITY**; Of balls: loss by the resistance of the air, 431; final velocity of descent, 431—Of sound, 425—Of the wind, 425.
- VENT**: Position and diameter, 3.
- VENT COVER**, 114, 118.
- VENT PIECE**, for brass ordnance, 3.
- VENT PUNCH**, 111.

W.

- WADS**: Fabrication, 268—For proving ordnance, 17, 18—For firing hot shot, 374.
- WAR ROCKETS**, 289—Ranges, 365.
- WASHERS**, for bolts: Classification and dimensions, 63.
- WATER**: Weight of cubic foot, 410, 417—Maximum density, 410—Density at different temperatures, 423—Allowance for man and horse, 419.
- WATER BUCKET**: For forge, 117—For garrison service, 117—Weights, 118.
- WATERING BUCKET**, for field service, 117, 118.
- WEDGE**: Mechanical power, 433.
- WEIGHTS**: Guns, 5—Columbiads and howitzers, 6—Mortars, 7—Foreign ordnance, 23—Shot and shells, 27, 28, 29—Lead balls, 29—Cast iron balls, 30—Field gun carriages, 55—Siege gun carriages, 56—Field and siege wagons, ammunition chests, and mortar beds, 57—Barbette carriages, 59—Casemate carriages, 61—Sling carts and gins, 62—Trucks, 54—Artillery implements, 108—Equipments, 118—Harness, 127—Gun carriage and equipment for mountain artillery, 145—Small arms, 163—Boxes of arms, 183—Swords and sabres, 199—Accoutrements, 207—Percussion cartridges, packed, 249—Fixed ammunition, 259—Field ammunition, packed, 260—Gun carriages and caissons, equipped for service, 306—Forges and battery wagons, equipped for service, 328—Chains, 402—Hemp and wire ropes, 403—Bar iron, 404, 407—Various metals, 406, 407—Iron pipes, 408—Various materials, (specific gravities,) 409—United States and Foreign weights, 416, 417.
- WELDING**: Composition for welding iron and steel, 390.
- WHEAT**: Weight of a bushel, 419.
- WHEEL**; *Field*: Nomenclature, 39; size and weight, 55—*Siege*: Nomenclature, 45; size and weight, 56—*Barbette*: Nomenclature, 47; size and weight, 59—*Casemate*: Size and weight, 61—Sling carts, 53, 62.
- WHEEL AND AXLE**: Mechanical power, 433.
- WHEELS AND PINIONS**: Power, 433.
- WHIP**, for artillery driver, 124.
- WIND**: Velocity and force, 425.
- WINDAGE** of balls: Definition, 3—Amount, 5, 6, 7—Loss of velocity by, 367.
- WIPER**, for mortars, 115.
- WIRE GAUGE**, 66.
- WIRE ROPE**, iron: Strength and weight, 403.
- WOOD**: See **TIMBER**.
- WOOD SCREWS**: Classification and dimensions, 65.
- WORMS**, 106, 108.

ERRATA.

- Page 37—List of *Irons*, 5th line: For *links*, read *rings*.
- “ 133—12th line from the bottom; Add: 4 *notch plates*, fastened to the arcs, each by 4 *screws*.
- “ 217—First column of table: For 4, read 1.
- “ 218—1st line: For weight, read height.
- “ 428—*Equation of the Trajectory*: In the 2nd term of the second member, for x , read x^2 .
- “ 437—19th line: The words “area of the” should be transposed to the beginning of the 18th line.

ORDNANCE MANUAL.

CHAPTER FIRST.

ORDNANCE.

The following are the kinds and calibres of ordnance used in the land service of the United States :

KIND OF ORDNANCE.*		CALIBRE.	MATERIAL.	
GUNS	Field.....	6-pounder...	Bronze....	} Plate 1.
		12-pounder...		
	Siege and garrison	12-pounder...	
		18-pounder...	
		24-pounder...	Iron	
Seacoast.....	32-pounder...		
	42-pounder...		
HOWITZERS.	Mountain	12-pounder...	} Plate 2.
	Field	12-pounder...	Bronze....	
		24-pounder...		
		32-pounder...		
	Siege and garrison	8-inch.....	
24-pounder...		Plate 10.	
Seacoast.....	8-inch.....	} Plate 2.	
	10-inch.....		
COLUMBIADS	8-inch.....	Iron	} Plate 9.
		10-inch.....		
MORTARS...	Light.....	8-inch.....	} Plate 2.	
		10-inch.....		
	Heavy.....	10-inch.....		
		13-inch.....		
	Stone mortar.....	16-inch.....		Bronze....
Coehorn	24-pounder...	Iron		
Eprouvette	24-pounder...			

A 12-inch columbiad, of cast iron, has also been made for trial.

The plates and the tables of dimensions and weights refer to the latest patterns.

For the description of ordnance of former patterns, see the first edition of this Manual.

Nomenclature.

The forms of the several pieces of ordnance are shown in the Plates referred to in the last column of the preceding table.

Cannon made of bronze are commonly called *brass cannon*.

The *casable* is the part of the gun in rear of the base ring; it is composed generally of the following parts: the *knob*, the *neck*, the *fillet*, and the *base of the breech*.

The *base of the breech* is a frustum of a cone, or a spherical segment, in rear of the breech.

The *base ring* is a projecting band of metal adjoining the base of the breech and connected with the body of the gun by a concave moulding.

The *breech* is the mass of solid metal behind the bottom of the bore, extending to the rear of the base ring.

The *reinforce* is the thickest part of the body of the gun, in front of the base ring; if there is more than one reinforce, that which is next to the base ring is called the *first reinforce*; the other, the *second reinforce*. In some howitzers, instead of a reinforce, there is a *recess* in the metal around the chamber, next to the base ring.

The *reinforce band* is at the junction of the first and second reinforces in the heavy howitzers and columbiads.

The *chase* is the conical part of the gun in front of the reinforce.

The *astragal* and *fillets*, in field guns, and the *chase ring* in other pieces, are the mouldings at the front end of the chase.

The *neck* is the smallest part of the piece, in front of the astragal or the chase ring.

The *swell of the muzzle* is the largest part of the gun in front of the neck. It is terminated by the muzzle mouldings, which, in field and siege guns, consist of the *lip* and the *fillet*. In the seacoast guns and heavy howitzers and columbiads, there is no fillet. In field and siege howitzers, and in mortars, a *muzzle band* takes the place of the swell of the muzzle.

The *face* of the piece is the terminating plane perpendicular to the axis of the bore.

The *trunnions* are cylinders, the axes of which are in a line perpendicular to the axis of the bore, and in the same plane with that axis.

The *rimbases* are short cylinders, uniting the trunnions with the body of the gun. The ends of the rimbases, or the *shoulders of the trunnions*, are planes perpendicular to the axis of the trunnions.

The *bore* of the piece includes all the part bored out, viz: the cylinder, the chamber, (if there is one,) and the conical or spherical surface connecting them.

The *chamber*, in howitzers, columbiads, and mortars, is the smaller part of the bore, which contains the charge of powder. In howitzers and columbiads the chamber is cylindrical; it is united with the large cylinder of the bore by a conical surface; the angles of intersection of this conical surface with the cylinders of the bore and chamber are rounded (in profile) by arcs of circles. In the 8-inch siege howitzer, the chamber is united with the cylinder of the bore by a spherical surface, in order that the shell may, when necessary, be inserted without a sabot.

A conical chamber which is joined to the cylinder of the bore by a portion of a spherical surface, (as in the 8-inch and 10-inch light mortars,) is called a *Gomer chamber*.

The *bottom of the bore* is a plane perpendicular to the axis, united with the sides (in profile) by an arc of a circle, the radius of which is one-fourth of the diameter of the bore at the bottom. In the columbiads, the heavy sea coast mortars, the stone mortar, and the eprouvette, the bottom of the bore is hemispherical.

The *muzzle*, or mouth of the bore, is chamfered to a depth of 0.15 inch to 0.5 inch, (varying with the size of the bore,) in order to prevent abrasion, and to facilitate loading.

The *true windage* is the difference between the true diameters of the bore and of the ball.

The axis of the *vent* is in a plane passing through the axis of the bore, perpendicular to the axis of the trunnions. In guns, and in howitzers having cylindrical chambers, the vent is placed at an angle of 80° with the axis of the bore, and it enters the bore at a distance from the bottom equal to one-fourth the diameter of the bore.

The diameter of the vent is *two-tenths* of an inch, in all pieces except the eprouvette in which it is *one-tenth*.

The vents of brass guns are bored in *vent pieces*, of wrought copper, which are screwed into the gun.

The *lock piece* is a block of metal at the outer opening of the vent, in some pieces of ordnance, to facilitate attaching a lock to the cannon.

The *natural line of sight* is a line drawn in a vertical plane through the axis of the piece, from the highest point of the base ring to the highest point in the swell of the muzzle, or to the top of the *sight*, if there is one.

The *natural angle of sight* is the angle which the natural line of sight makes with the axis of the piece.

PRINCIPAL DIMENSIONS AND WEIGHTS OF GUNS.

DIMENSIONS AND WEIGHTS OF MORTARS.

OF THE MATERIALS FOR ORDNANCE.

Bronze.

Bronze for cannon, (commonly called *brass*,) consists of 90 parts of copper, and 10 of tin, allowing a variation of one part of tin, more or less. It is more fusible than copper, much less so than tin, more sonorous, harder, and less susceptible of oxidation, and much less ductile, than either of its components. Its fracture is of a yellowish color, with little lustre, a coarse grain, irregular, and often exhibiting spots of tin, which are of a whitish color. These spots indicate defects in the metal; but they seldom contain more than 25 per cent. of tin. The specific gravity of bronze is about 8,700, being greater than the mean of the specific gravities of copper and tin.

Pure copper is of a red color, inclining to yellow; it has a fine metallic lustre. Its fracture exhibits a short, even, close grain, of a silky appearance; it is very ductile and very malleable. The greater the purity of copper, the more malleable it is, and the finer the grain. Specific gravity from 8,600 to 9,000.

Pure tin is of a white color, a little darker than silver; it is malleable, and susceptible of being rolled into sheets, but it is not very ductile; it is very soft, and, when bent backwards and forwards, it gives a peculiar crackling sound, the distinctness of which is in proportion to the purity of the tin. Specific gravity, 7,290 to 7,320.

Analysis of bronze. Nitric acid dissolves the copper and converts the tin into an insoluble peroxide. Put into a small glass matrass 10 parts (say 100 grains) of bronze, in small particles, and 80 parts of very pure nitric acid, at 22° Beaumé's hydrometer, (specific gravity, 1,180;) heat it gradually to ebullition, and continue that heat until red vapors cease to come over. Let it settle; pour off the liquor, and add to the oxide of tin 20 parts of nitric acid; let it boil ten minutes; decant the liquor again, and repeat the same operation; dilute the first portion decanted with 2 or 3 times its volume of water, and pass it through a filter; do the same with the second and third portions. Then throw the oxide of tin on a double filter, the two parts of which are equal; wash the precipitate on the filter until the water that comes off no longer gives a blue color when heated with ammonia, and does not change the color of litmus paper. Spread the filter on paper, and dry it perfectly in a stove or a sand bath. Weigh it, adding the exterior filter to the weights, in order to ascertain the quantity of peroxide of tin which remains on the upper filter; 127 parts of peroxide give 100 parts of pure tin.

If lead is present, it will be dissolved by the acid. To detect it:—after the solution is cool, add sulphate of soda, in order to precipitate the lead in the state of an insoluble sulphate, 145 parts of which contain 100 of lead.

Cast Iron.

(See also Chapter 14.)

Iron for making cannon must be of the best quality of charcoal iron, made in a smelting furnace, with a cold blast, and should be selected particularly for its strength. It should be soft, yielding easily to the file or chisel; its fracture presenting an uniform appearance; color, dark grey; aspect, brilliant; chrystals of medium size.

When cast into cannon, it should approach that degree of hardness which resists the file and the chisel, but not too hard to be bored and turned without great difficulty. Its color a bright lively grey; chrystals small, with acute angles, and sharp to the touch; structure uniform, close, and compact. If the pig iron be too soft, coarse, and loose, its strength and density may be increased by remelting it once or twice, and by continuing it in fusion several hours, under a high heat.

But as the quality of cast iron cannot be accurately determined by an inspection of its fracture alone, samples taken from the pig iron, and from the sinking heads of cannon are submitted to practical tests. The mean specific gravity of pig iron is 7.00; and its tenacity is about 16,000 pounds to the square inch.

The following table shows some of the results obtained in the trials of samples from gun heads:

DATE.	DESIGNATION OF GUNS.				IRON.

	Mean.....	241	7.248	29,693

In making guns from iron of which the quality is not known, a sample gun is made and proved to extremity, with gunpowder. The gun adopted for this proof is a long 9-pounder gun, of the same pattern as the 8-pounder used for the same purpose in France and Belgium. It is fired with the following series of charges, viz :

1st.	20 rounds,	3	pounds of powder,	1 ball.	} Without wads.
2d.	20 "	4.5	" "	2 "	
3d.	10 "	4.5	" "	3 "	
4th.	5 "	9	" "	6 "	
5th.	-	18	" "	13 "	

In order that the iron shall be used for ordnance, the trial gun should sustain the first four series of rounds without breaking.

INSPECTION OF ORDNANCE.

Instruments.

1. *Star gauge.*—This is an instrument for measuring the diameter of the bore of a gun, at any part.

The head is of brass, with four steel sockets for the measuring points. Two of the sockets are soldered fast into the head; the other two are moveable. The moveable sockets and points are pushed out by means of two inclined cylinders, which are fastened to a stem, forming a conical slider. This slider tapers 0.35 in. in a length of 2.2 in.; so that by pushing the slider the 35th part of this length (about .06 in.) the distance between the moveable points is increased .01 in.

The slider is connected with a square steel rod, consisting of three parts, which are screwed together, according to the length of bore to be measured. This rod slides through a brass tube, which is also made in three pieces.

The tube is graduated, in inches and quarters, commencing at the measuring points, so as to indicate the distance of the latter from the muzzle of the gun.

The handle is of wood attached to a brass cylinder, or socket, through which the sliding rod passes. In the tube of the handle there is a slit, on the side of which a scale is marked, to indicate the movements of the measuring points. Each joint of the long tube has a mark, made on a small plate of silver, which shows the place of the zero on the scale, when the measuring points are adjusted to the true diameter of the bore. In this position the handle is fixed on the sliding rod by means of a screw clamp.

A *ring gauge*, for each calibre, is used for adjusting the instrument for use.

A *rest*, in the form of a T, is placed in the mouth of the gun, to keep the instrument in the axis of the bore. This rest has three slides, which can be

adjusted to the different sizes of bore; the upright branch is moveable, for convenience of packing.

The star gauge, its points and rest, are packed in one box, and the ring gauges in another.

2. *The cylinder staff.*—This is a round staff, made of mahogany, or other hard wood. It is in two parts, which are joined together by brass sockets and screws; each part has also a brass socket and screw at the outer end, to receive the *cylinder gauge, guide plate, measuring point, and searcher.* The staff is graduated, in inches and tenths, on a strip of brass let into it, on one side. These graduations are arranged to read the distances from the extremity of the measuring point, when it is screwed on the staff.

The cylinder staff is supported, at the muzzle of the piece, by a *half tompon* of wood, having in the centre a groove of the size of the staff. The *rest* for the star gauge may be used also for this purpose.

3. *The cylinder gauge* is a hollow cylinder of wrought or cast iron, turned to the exact minimum (or true) diameter of the bore. The length of the cylinder is equal to its diameter. It has cross heads, at right angles to each other; one with a smooth hole of the same diameter as the cylinder staff; the other tapped for the screw of the staff socket.

4. *The searcher* is used to ascertain whether there are any cavities in the bore. It consists of four flat springs about 13 inches long, with sharp points, turned outwards at the end, attached to a socket on which the cylinder-staff is screwed.

5. *The guide-plate* is a circular iron plate 0.2 inch thick, and of the minimum diameter of the bore; it has a hole in the centre, with a thread by which it is screwed to the cylinder-staff; it serves to direct the measuring point to the centre of the bottom of the bore.

6. *The measuring point* is screwed on the end of the cylinder staff, over the guide-plate, to measure the depth of the bore; it is of iron, cylindrical in shape, so far as it screws on the end of the staff, and tapering down to the diameter of 0.75 inch.

7. *The trunnion-gauge* is an iron ring of the diameter of the trunnions which must pass over them and fit closely. The exterior diameter of this gauge serves to verify that of the rimbasés.

8. *The trunnion-square* is a double square of wood, the distance between whose branches is the same as that between the rimbasés of the gun; in the centre is a pointed sliding plate, with a thumb-screw to fasten it; the lower edges of the branches, which are shod with iron, are in the same plane, parallel to the upper edge of the connecting piece, so that when the square is placed with its branches resting on the trunnions, the upper edge of the connecting

piece is parallel to their axis. Each branch has also an iron plate projecting perpendicularly from one side to rest on the top of the trunnions. It is used to ascertain the position of the trunnions in relation to the axis of the bore and to each other.

9. The *trunnion rule*, for measuring the distance from the rear of the base ring to the rear of the trunnions.

10. *Callipers*, to measure diameters.

11. A *standard scale*, for verifying other instruments.

12. A *wooden rule*, to measure exterior lengths.

13. The *vent-gauges* are two pointed pieces of steel wire, 0.005 in. greater and less than the true diameter of the vent.

14. The *vent-searcher* is a hooked steel wire, about half the diameter of the vent.

15. A *rammer-head*, shaped to the form of the bottom of the bore, and furnished with a staff, is used to ascertain the interior position of the vent.

16. A *mirror*; a *wax taper*; *bees-wax*.

17. *Rammer*, *sponge*, and *priming wire*.

18. *Figure and letter stamps*, to affix the required marks.

Inspection of Iron Ordnance.

Cannon presented for inspection and proof, are placed on skids for the convenience of turning and moving them easily. They are first examined carefully on the exterior, to ascertain whether there are any flaws or cracks in the metal, whether they are finished as prescribed, and to judge, as well as practicable, of the quality of the metal. They must not be covered with paint, lacker, or any other composition. If it is ascertained that an attempt has been made to conceal any flaws or cavities by plugging, or filling them with cement, or any substance, the gun is rejected without further examination. After this preliminary examination, the inspector proceeds to verify the dimensions of the piece. The *interior of the bore* is first examined by reflecting the sun's rays into it from the mirror; or, if the sun is obscured, by a lighted wax taper or a lamp placed on the end of a rod, and inserted into the bore. The *searcher* is then introduced, and pushed slowly to the bottom of the bore and withdrawn, turning it at the same time; if one of the points hangs, the position of the hole is marked on the outside of the gun by noticing its distance from the muzzle, and its position in the bore; the size and figure of the cavity are found by taking an impression of it in *wax* placed on the end of a hook. The *cylinder-gauge*, screwed on the staff, is then pushed gently to the bottom of the cylindrical part of the bore and withdrawn; it must go to the bottom, or the bore is too small.

The *bore of the piece* is then measured with the star gauge. The measurements should be made at intervals of $\frac{1}{4}$ inch in the part of the bore occupied by the shot; at intervals of 1 inch in the rest of the bore in rear of the trunnions, and of about 1 calibre from the trunnions to the muzzle.

The *position of the trunnions*, with regard to the axis of the bore and to each other, is next ascertained.

To verify the position of the axis of the trunnions: set the trunnion-square on the trunnions, and see that the lower edges of its branches touch them throughout their whole length; push the slide down till it touches the surface of the piece, and secure it in that position by the thumb-screw; turn the gun over, and apply the trunnion square to the opposite side, and if, when the point of the slide touches the surface of the piece, the lower edges of the branches rest on the trunnions, the axis of the trunnions is in the same plane with the axis of the bore; if they do not touch the trunnions, their axis is above the axis of the bore by half the space between; and if the edges touch the trunnions, and the point of the slide does not touch the surface of the piece, their axis is below the axis of the bore. If the *alignment of the trunnions* be accurate, the edges of the trunnion-square will fit on them when applied to different parts of their surface; their diameter and cylindrical form, and the diameter of the rimbases, are verified with the trunnion-gauge.

To ascertain the length of the bore, screw the guide-plate and measuring-point on the cylinder staff, and push them to the bottom of the bore; place a half-tom-pion in the muzzle, and rest the staff in its groove; apply a straight-edge to the face of the muzzle, and read the length of the bore on the staff. The exterior lengths are measured by the rule, or by a profile, the accuracy of which is first verified. The exterior diameters are measured with the callipers and graduated rule. The position of the interior orifice of the vent is found from the mark made on the rammer-head by the vent-gauge inserted in the vent, while the rammer-head is held against the bottom of the bore—two impressions are taken. The position of the exterior orifice of the vent is also verified. The vent is examined with gauges, and with the vent-searcher, to ascertain if there are any cavities in it. In mortars, the dimensions of the conical chambers, and the form of the breech, may be verified with patterns made of plate iron. After the powder proof, the bore is washed and wiped clean, and the bore and vent are again examined, and the bore remeasured. The results of each of the measurements and examinations are noted on the inspection report against the number of the gun.

VARIATIONS ALLOWED IN THE DIMENSIONS OF IRON ORDNANCE.

<i>In the eprouvette, no variation is allowed.</i>			

The whole exterior surfaces of iron guns, columbiads, and howitzers are turned in the lathe, or dressed smooth in the parts which cannot be turned.

Inspection of Brass Ordnance.

Brass cannon are measured, and their dimensions recorded, as prescribed for iron cannon. *The exterior form and dimensions* are verified by the application of a *profile* cut out of sheet iron, of the exact shape of a longitudinal section of the piece. All brass ordnance, except stone mortars, should be bored under size from .04 to .05 inch, and after proof reamed out to the exact calibre. When the powder proof is finished, the bore should be cleaned and examined; the vent should then be stopped with a greased wooden plug, the muzzle raised, and the gun filled with water, to which pressure shall be applied to force it into any cavities that exist; or the water shall be allowed to remain in the bore about 24 hours. *The bore* must then be sponged dry and clean, and viewed with the *mirror* or *candle*, to discover if any water oozes from cracks or cavities, and also if any enlargement has taken place. The quantity of water that runs out of a crack or honey-comb will indicate the extent of the defect, and if it exceeds a few drops, the gun should be rejected, although the measured depth of the cavity may not exceed the allowance. If the water oozes out between the vent piece and the metal of the gun, a new vent piece must be inserted, and the gun again proved with one charge, and the water proof repeated. After the bore has been reamed out to the proper size, its dimensions are again verified, and an examination of the bore and vent is made, to detect any defects which may have been caused or developed by the proof. *Whitish spots* show a separation of the tin from the copper, and, if extensive, should condemn the piece. A *great variation from the true weight*, which the dimensions do not account for, shows a defect in the alloy. Any attempt to conceal cavities by filling them with screws, or by any other methods, should cause the rejection of the piece.

Brass cannon should be rejected for the following cavities or honey-combs:

Exterior.—Any hole or cavity 0.25 inch deep in front of the trunnions, and 0.2 inch deep at or behind the trunnions.

Interior.—From the muzzle to the reinforce, any cavity 0.15 inch deep. Any cavity from the reinforce to the bottom of the bore.

The specific gravity of the metal of brass ordnance should be occasionally ascertained, by taking that of some of the heaviest, and some of the lightest pieces, at each inspection.

The exterior surfaces of all brass ordnance are turned, or dressed smooth.

VARIATIONS ALLOWED IN THE DIMENSIONS OF BRASS ORDNANCE.

	Inch.
Length of bore, more or less.....	0.1
Diameter of bore.....	{ more..... .02
	{ less..... .00

Position of mouldings, more or less.....	.10
Any exterior diameter from the base ring to the muzzle inclusive, and diameter of rimbases, more or less.....	.04
Diameter of cascable, neck, and knob, more or less05

A proper discretion must be exercised in the inspection of ordnance; such slight imperfections as do not injure a piece for service may be disregarded, whilst the instructions should be strictly enforced with regard to defects which may impair its utility.

PROOF OF ORDNANCE.

Gunpowder for proving ordnance should be of the best quality, ranging not less than 250 yards by the *eprouvette*; it should be proved immediately before being used, unless it shall have been proved within one year previously, and there be no reason to suspect that it has become deteriorated.

The *cartridge bags* are made of woollen stuff, or of paper, the full diameter of the bore or chamber. They are filled by weight, and if not filled at the place where the guns are proved, each bag should be enveloped in a paper cylinder and cap, marked with the weight of powder and its proof range.

The *shot* must be smooth, free from seams and other inequalities that might injure the bore of the piece, and they must be of the true diameter given in the tables.

The *wads* are made of junk, as described in CHAPTER X.

PROOF OF IRON ORDNANCE.

Guns and *howitzers* are laid with the muzzle resting on a block of wood and the breech on the ground, or on a thick plank, giving the bore a small elevation.

Mortars are mounted on strong wooden frames or beds, at an elevation of 45°, supported by the trunnions.

In proving iron ordnance, after pricking the cartridge, prime with powder, or a tube, and place over the vent a piece of portfire, set in clay or putty, long enough to permit the man who fires it to reach a place of safety before the charge explodes.

Proof charges for Iron Guns.

FIRST AND SECOND ROUNDS.—A charge of powder equal to *one-half* of the weight of the shot; *two shot* and *one wad*.

THIRD ROUND.—A charge of powder equal to *one-third* of the weight of the shot; *one shot* and *one wad*.

In proving new guns, a compound shot, or a cylinder with hemispherical ends, of the true diameter of the shot, and equal in weight to the two shot, shall be used instead of them.

The wad is placed over the cylinder or the upper ball; the whole being well rammed.

Should any of the guns proved at one time fail to sustain the above proof, the remainder shall be again fired *twice* with a charge of powder equal to *one-half* of the weight of the shot, *one shot* and *one wad*; and if, in either or both of these trials, *one-fourth* of the whole number of guns should fail, the whole shall be rejected.

Other iron ordnance are fired with the following charges:

Columbiads.

10-inch.—1st round: 20 lbs. of powder, one 10-inch strapped shot, and one wad over the shot.

2nd round: 24 lbs. of powder, one 10-inch shell strapped.

8-inch.—1st round: 12 lbs. of powder, one 8-inch strapped shot and one wad.

2nd round: 15 lbs. of powder, one 8-inch shell strapped.

Howitzers.

SEA COAST.	{	10-inch.—2 rounds, with 15 lbs. of powder, one 10-inch strapped shot, and one wad over the shot.
		8-inch.—2 rounds, with 12 lbs. of powder, one 8-inch strapped shot, and one wad over the shot.
SIEGE AND GARRISON.	{	8-inch.—2 rounds, with 4 lbs. of powder, one 8-inch shot, and one wad over the shot.
		24-pdr.—2 rounds, with 3 lbs. of powder, one 24-pdr. strapped shot, and one wad over the shot.

Mortars.

HEAVY....	{	13-inch.—2 rounds, with 20 lbs. of powder, and one 13-inch shot.
		10-inch.—2 rounds, with 10 lbs. of powder, and one 10-inch shot.
LIGHT....	{	10-inch.—2 rounds, with 5 lbs. of powder, and one 10-inch shot.
		8-inch.—2 rounds, with 2½ lbs. of powder, and one 8-inch shot.

Should any columbiad, howitzer, or mortar fail to sustain the above proof, the remainder of those offered at the same time shall be again fired *twice* with the same charges; and if, in either or both of these trials, *one-fourth* of the whole number should fail, the whole shall be rejected.

The *water proof*, as described for brass cannon, must also be applied occasionally to iron cannon, at the discretion of the inspector.

The bore and vent and the exterior surface of every piece which is approved, should be well covered with sperm oil immediately after the inspection.

PROOF OF BRASS ORDNANCE.

They are mounted on appropriate carriages or beds, and fired three times; *guns* and *howitzers* at an elevation of 50°, *mortars* at an elevation of 45°; with the following charges:

Field Guns.

A charge of *powder* equal to *one-third* of the weight of the shot, *one shot* and *one wad*.

Howitzers.

FIELD,	{	32-pdr.—3¼ lbs. of powder, one strapped shot and one wad.
		24-pdr.—2½ lbs. of powder, one strapped shot and one wad.
		12-pdr.—1½ lbs. of powder, one strapped shot and one wad.
MOUNTAIN,		12-pdr.—¾ lb. of powder, one strapped shot and one wad.

Mortars.

STONE MORTAR.— $2\frac{1}{2}$ lbs. of powder, covered by a wooden tomption 2 inches thick ; a basket filled with alternate layers of stones and earth, weighing 100 lbs.

COEHORN, 24-pdr.— $\frac{3}{4}$ lb. of powder, and one 24-pdr. shot.

In proving brass cannon in service, or after they have been bored to the proper calibre, the shot should be wrapped in cloth or strong paper to save the bore as much as possible from injury.

MARKS.

All cannon are required to be weighed and to be marked, as follows, viz : the *number of the gun*, and the *initials of the inspector's name*, on the face of the muzzle ; the numbers in a separate series for each kind and calibre at each foundry ; the initial letters of the *name of the founder* and of the foundry, on the end of the right trunnion ; the *year of fabrication* on the end of the left trunnion ; the *foundry number* on the end of the right rimbase, above the trunnion ; the *weight of the piece in pounds* on the base of the breech ; the letters U. S. on the upper surface of the piece, near the end of the reinforce.

The natural line of sight, when the axis of the trunnions is horizontal, should be marked on the base ring and on the swell of the muzzle, whilst the piece is in the trunnion lathe.

Cannon rejected on inspection are marked X C, on the face of the muzzle ; if condemned for erroneous dimensions which cannot be remedied, add X D ; if by powder proof, X P ; if by water proof, X W.

INJURIES CAUSED BY SERVICE.

Brass cannon are little subject to external injury, except from the bending of the trunnions sometimes after long service, or heavy charges.

Internal injuries are caused by the action of the elastic fluids developed in the combustion of the powder, or by the action of the shot in passing out of the bore. These effects generally increase with the calibre of the piece.

Of the first kind, which exhibit themselves in rear of the shot, are : *the enlargement of the bore* by the compression of the metal, which is seldom a serious defect ; *corrosion of metal*, particularly at the angles, such as the inner orifice of the vent, or the mouth of a cylindrical chamber ; *cracks*, from the yielding of the cohesion of the metal ; *cavities*, cracks enlarged by the action of the gas, and by the melting of the metal ; observable especially in the upper surface of the bore.

Injuries of the second kind, which appear in front of the charge, are : *The lodgment of the shot*, a compression of the metal on the lower side of the bore, at the seat of the shot, caused by the pressure of the fluid in escaping over the top of the shot. There is a corresponding *burr* in front of the lodgment and the motion thereby given to the shot causes it to strike alternately on the top and bottom of the bore, producing other *enlargements*, generally *three* in number ; the first, on the upper side, a little in advance of the trunnions ; the second, on the lower side, about the astragal ; the third, in the upper part of the muzzle ; it is chiefly from this cause that brass guns become unserviceable ; the extent of the injury varies according to the length of the bore. *Scratches* caused by the fragments of a broken shot, or the roughness of an imperfect one : *enlargement* of the muzzle by the striking of the shot in leaving the bore ; *exterior cracks*, or longitudinal splits, caused by too great a compression of the metal on the interior.

The durability of brass cannon may be much increased by careful use, and by the precautions of *increasing the length of the cartridge*, or that of the *sabot*, or using *a wad over the cartridge*, in order to change the place of the shot ; by *wrapping the shot in woollen or other cloth*, or in *paper*, so as to diminish the windage and the bounding of the shot in the bore. In *field guns*, both brass and iron, the *paper cap*, which is taken off from the cartridge should always be put over the shot.

Iron cannon are subject to the above defects in a less degree than brass, except the corrosion of the metal, by which the vent especially is rendered unserviceable from enlargement. The principal cause of injury to iron cannon is the *rusting* of the metal, producing a roughness and enlargement of the bore, and an increase of any cavities or *honey combs* which may exist in the metal.

The service to which an iron cannon has been subjected may generally be determined by the appearance of the vent.

Spiking and unspiking cannon, and rendering them unserviceable.

To spike a piece, or to render it unserviceable: Drive into the vent a jagged and hardened steel spike with a soft point, or a nail without a head ; break it off flush with the outer surface and clinch the point inside by means of the rammer. Wedge a shot in the bottom of the bore by wrapping it with felt, or by means of iron wedges, using the rammer or a bar of iron to drive them in ; a wooden wedge would be easily burnt by means of a charcoal fire lighted with the aid of a bellows. Cause shells to burst in the bore of brass guns, or fire broken shot from them with high charges. Fill a piece with sand over the

charge to burst it. Fire a piece against another, muzzle to muzzle, or the muzzle of one to the chase of the other. Light a fire under the chase of a brass gun, and strike on it with a sledge to bend it. Break off the trunnions of iron guns; or burst them by firing them with heavy charges and full of shot, at a high elevation.

When guns are to be spiked temporarily, and are likely to be retaken, a *spring spike* is used, having a shoulder to prevent its being too easily extracted.

To unspike a piece: If the spike is not screwed in or clinched, and the bore is not impeded, put in a charge of powder of $\frac{1}{2}$ the weight of the shot and ram junk wads over it with a handspike, laying on the bottom of the bore a strip of wood with a groove on the under side containing a strand of quick match by which fire is communicated to the charge; in a brass gun, take out some of the metal at the upper orifice of the vent, and pour sulphuric acid into the groove for some hours before firing. If this method, several times repeated, is not successful, unscrew the vent piece, if it be a brass gun, and if an iron one, drill out the spike, or drill a new vent.

To drive out a shot wedged in the bore: Unscrew the vent piece, if there be one, and drive in wedges so as to start the shot forward, then ram it back again in order to seize the wedge with a hook; or pour in powder and fire it, after replacing the vent piece. In the last resort, bore a hole in the bottom of the breech, drive out the shot, and stop the hole with a screw.

Preservation of Ordnance.

Cannon should be placed together, according to kind and calibre, on skids of stone, iron, or wood, laid on hard ground, well rammed and covered with a layer of cinders, or of some other material, to prevent vegetation.

Guns and long howitzers.—The pieces should rest on the skids in front of the base ring and in rear of the astragal; the axis inclined at an angle of 4 or 5 degrees with the horizon, the muzzle lowest; the trunnions touching each other; or if space is wanting for that arrangement, the trunnion of one piece may rest on the adjoining piece, so that the axis of the trunnions is inclined about 45° with a horizontal line; the vent down, stopped with a greased wooden plug, or with putty or tallow. If circumstances require it, the pieces may be piled in two tiers, with skidding placed between them, exactly over those which rest on the ground; the muzzles of both tiers in the same direction and their axes preserving the same inclination.

Short howitzers and mortars.—On thick planks, standing on their muzzles, the trunnions touching, the vents stopped.

Iron ordnance should be covered on the exterior with a lacker impervious to water, (see CHAP. VII) ; the bore and the vent should be greased with a mixture of oil and tallow, or of tallow and beeswax melted together and boiled to expel the water. The lacker should be renewed as often as requisite, and the grease at least once every year.

The lacker and grease should be applied in hot weather.

The cannon should be frequently inspected, to see that moisture does not collect in the bore.

ORDNANCE OF FOREIGN COUNTRIES.

The materials for the following table have been collected, with few exceptions, from the manuals of artillery in England, France, Belgium, Prussia, and Austria, and from memoranda obtained in Russia and Sweden.

The dimensions and weights are given in our own measures.

The column of *exterior length* shows the length from the rear of the base ring to the face of the piece, and the *length of bore* includes the chamber, when not otherwise mentioned.

In *England, France, Belgium, and Sweden*, howitzers and mortars take their denominations, as with us, from the diameter of the bore, or from the calibre of a gun of corresponding bore; in *Austria and Prussia*, from the weight of a stone ball of the calibre of the bore; in *Russia*, from the true weight of the shell.

CHAPTER SECOND.

SHOT AND SHELLS.

NOMENCLATURE, DIMENSIONS, WEIGHTS.

The 8-inch mortar shell is used for the siege howitzer.

The *ears* of a shell are holes for the points of the shell hooks, 0.5 inch in diameter, bored opposite to each other, and perpendicular to the axis of the fuze hole; the metal is cut out above them at the distance indicated in the table, in a direction perpendicular to the axis of the holes, which must remain 0.25 inch deep, with a thickness of 0.25 inch of metal above them, at the thinnest part.

Carcasses,

Are shells having three additional holes, of the same dimensions as the fuze hole, pierced at equal distances apart in the upper hemisphere of the shell, with their exterior openings tangent to the great circle which is perpendicular to the axis of the fuze hole.

8		3.908	22	5.476	36	6.442	50	7.198

The specific gravity of shot and shells is about 7,000.

To find the weight of a cast iron shot or shell:

Multiply the cube of the diameter of the shot in inches, or the difference of the cubes of the exterior and interior diameters of the shell, by 0.134 for the weight in pounds.

For lead balls, the multiplier is 0.2142.

To find the diameter of a cast iron shot of a given weight:

Divide the weight in pounds by 0.134, and the cube root of the quotient will be the diameter in inches.

To find the quantity of powder which a shell will contain:

Multiply the cube of the interior diameter of the shell in inches by 0.01744, for the weight of powder in pounds.

INSPECTION OF SHOT AND SHELLS.

Shot and shells should be made of grey or mottled iron, of good quality, (see **CHAP. XIV. Cast iron.**) They must be cast in sand, and not in iron moulds; the shot from the latter are generally not spherical in form, nor uniform in size; they are also full of cavities, and are cracked by being heated.

Spherical case shot must be made with peculiar care, of the best quality of iron, in order that they may not be liable to break in the gun.

Shot.

INSPECTING INSTRUMENTS: One *large* and one *small gauge* and one *cylinder gauge* for each calibre: the cylinder gauge has the same diameter as the large gauge; it is made of cast iron, and is 5 calibres long. One *hammer*, weighing half a pound and having a flat face and a conical point. *Steel punches*.

One *searcher*, of steel wire No. 20, with a handle.

The shot should be inspected before they become rusty; after being well cleaned, each shot is placed on a table and examined by the eye to see that its surface is smooth, that the metal is sound and free from seams, flaws and blisters. If cavities or small holes appear on the surface, strike the point of the hammer or punch into them and ascertain their depth with the searcher; if the depth of the cavity exceed 0.2 inch, the shot is rejected; and also if it appear that an attempt has been made to conceal such defects by filling up the holes with nails, cement, &c.

The shot must pass in every direction through the large gauge and not at all through the small one; the founder should endeavor to bring the shot up as near as possible to the *large gauge* or to the *true diameter*.

N. B. The diameters of the small gauges have been recently increased, in order to produce greater uniformity in the dimensions of shot and shells, by reducing the limits of variation allowed in their fabrication. The new gauges are to be used only in the inspection of shot and shells to be hereafter made, and the projectiles now on hand are not to be rejected from service on account of passing through these gauges.

After having been thus examined, the shot are passed through the *cylinder gauge*, which is placed at an inclination of about 2 inches between the two ends and supported on blocks of wood in such a manner as to be easily turned from time to time, to prevent its being worn in furrows. Shot which *slide* or *stick* in the cylinder are rejected; the latter must be pushed out from the lower end with a wooden rammer.

Shot are proved by dropping them from a height of 20 feet on a block of iron, or rolling them down an inclined plane of that height, against another shot at the bottom of the plane.

The average weight of the shot is deduced from that of three parcels of 20 to 50 each, taken indiscriminately from the pile: some of those which appear to be the smallest should be also weighed, and they are rejected if they fall short of the weight expressed by their calibre more than one *thirty-second* part. They almost invariably exceed that weight.

Grape and Canister shot.

The dimensions are verified by means of a large and a small gauge attached to the same handle. The surface of the shot should be smooth and free from seams.

Shells and hollow shot.

INSPECTING INSTRUMENTS.—A large and small gauge for each calibre, and a cylinder gauge for shells of 8 inches and under.

Callipers for measuring the thickness of the metal at the sides of the shell.

Callipers, to measure the thickness at the bottom of the shell.

Gauges for the dimensions of the fuze hole, and for the thickness of metal at the fuze hole.

A pair of hand bellows; a wooden plug to fit the fuze hole, and bored through to receive the nozzle of the bellows.

A hammer; a searcher; a cold chisel; steel punches.

The surface of the shell and its exterior dimensions are examined as in the case of shot. The shell is next struck with the hammer to judge by the sound whether it is free from cracks; the position and dimensions of the ears are verified; the thickness of metal is then measured at several points on the great circle perpendicular to the axis of the fuze hole, and at the bottom, and at the fuze hole. The diameter of the fuze hole, which should be accurately reamed, is then verified, and the soundness of the metal about the inside of the hole is ascertained by inserting the finger.

The shell is now placed on a trivet in a tub containing water deep enough to cover it nearly to the fuze hole; the bellows and plug are inserted into the fuze hole and the air forced into the shell; if there are any holes in the shell, the air will rise in bubbles through the water. This test also gives another indication of the soundness of the metal, as the parts containing cavities will dry more slowly than the other parts.

The mean weight of shells is ascertained in the same manner as that of shot.

Shot and shells rejected in the inspection are marked with a X, made with the cold chisel; on shot near the gate, and on shells, near the fuze hole.

PRESERVATION AND PILING OF BALLS.

Balls should be carefully lackered as soon as possible after they are received. For the composition of lacker and the manner of applying it, see CHAP. VII.

When it becomes necessary to renew the lacker, the old lacker should be removed by rolling or scraping the balls, which should never be heated for that purpose.

Balls are piled according to kind and calibre, under cover if practicable, in a place where there is a free circulation of air, to facilitate which the piles should be made narrow if the locality permits; the width of the bottom tier may be from 12 to 14 balls, according to the calibre.

Prepare the ground for the base of the pile by raising it above the surrounding ground so as to throw off the water; level it, ram it well, and cover it with a layer of screened sand. Make the bottom of the pile with a tier of unserviceable balls buried about two-thirds of their diameter in the sand; this base may be made permanent: clean the base well and form the pile, putting the fuzee holes of shells downwards, in the *intervals*, and not resting on the shells below. Each pile is marked with the number of serviceable balls it contains.

The base may be made of bricks, concrete, stone, or with borders and braces of iron.

Grape and canister shot should be oiled or lathered, put in piles, or in strong boxes, on the ground floor, or in dry cellars; each parcel marked with its kind, calibre, and number.

To find the number of balls in a pile.

Multiply the sum of the three parallel edges by one-third of the number of balls in a triangular face.

In a square pile, one of the parallel edges contains but one ball; in a triangular pile, two of the edges have but one ball in each.

The number of balls in a triangular face is $\frac{n(n+1)}{2}$; n being the number in the bottom row.

The sum of the three parallel edges in a triangular pile is $n + 2$; in a square pile, $2n + 1$; in an oblong pile, $3N + 2n - 2$; N being the length of the top row, and n the width of the bottom tier: or, $3m - n + 1$; m being the length and n the width of the bottom tier.

If a pile consist of two piles joined at a right angle, calculate the contents of one as a common oblong pile, and of the other as a pile of which the three parallel edges are equal.

In the following Table of the number of balls in a pile, the second line shows the number in a triangular pile, the base of which is the corresponding number in the first line.

The other numbers show the contents of square and oblong piles; the length and width of the base being in the upper line and in the left hand column respectively.

CHAPTER THIRD.

ARTILLERY CARRIAGES.

NOMENCLATURE.

The nomenclature and the tables of dimensions and weights given in this chapter, apply to the latest patterns adopted. The parts are enumerated generally in the order in which they are put together.

The classification adopted for bolts, nuts, chains, nails, screws, &c., is shown in the tables following the nomenclature.

FIELD GUN CARRIAGES.—Plate 3.

There are three gun carriages for field artillery, viz :

One for the 6-pounder gun and the 12-pounder howitzer.

One for the 24-pounder howitzer.

One for the 12-pounder gun and the 32-pounder howitzer.

The parts of these carriages are all similar, differing only in their dimensions.

Wood.

1 stock, in two pieces ; 2 dowels ; 2 cheeks ; 1 axle body.

Irons.

- | | |
|---|---|
| 2 trail handles. | 1 eye plate, for sponge and rammer chains. |
| 2 bolts and 2 nuts for do. | 2 screws, for eye-plate. |
| 1 lock-chain bolt, 1 washer, and 1 nut. | 2 chains and hasps, for sponges and rammers. |
| 1 eye-plate for lock-chain. | 2 turnbuckles, (BRASS.) |
| 1 lock-chain, No. 5, 3 links, 1 toggle. | 2 stud plates, for turnbuckles. |
| 1 lunette, for the trail. | 2 trunnion plates. |
| 1 trail-plate; 2 rivets. | 20 nails, for do., in 6-pdr. and 24-pdr. howitzer carriage. |
| 12 nails, for lunette and trail plate. | 28 nails, in 12 pdr. carriage. |
| 1 large pointing ring and plate. | 2 chin bolts; 2 bevel washers and 2 nuts. |
| 2 bolts and 2 nuts, for do. | 2 key bolts; 2 nuts. |
| 1 small pointing ring. | 6 cheek bolts; 4 washers; 6 nuts. |
| 2 bolts and 2 nuts, for do. | 2 cap squares; 2 eye pins. |
| 2 wheel guard plates. | 2 cap-square chains; 2 eye pins. |
| 10 nails, for do. | 2 cap-square keys. |
| 2 prolonge hooks. | 2 key chains; 2 eye pins. |
| 8 nails, for do. | 2 D rings, for handspikes. |
| 1 stop, for rammer head. | 4 staples, for D rings. |
| 4 nails, for do. | 1 linstock-socket. |
| 1 ear-plate, for worm. | 6 nails, for do. |
| 2 nails, for do. | |
| 1 key, for worm. | |
| 1 key chain; 1 eye pin. | |

FIELD-GUN CARRIAGES—*Irons*—(Continued.)

6 <i>rondelles</i> , (CAST IRON.)	2 <i>axle bands</i> .
3 <i>assembling bolts</i> .	6 <i>nails</i> , for do.
3 <i>washers</i> and 3 <i>nuts</i> , for do.	1 <i>box for elevating screw</i> , (BRASS.)
1 <i>washer hook</i> , for lock chain.	2 <i>bolts</i> , for do.; 2 <i>washers</i> ; 2 <i>nuts</i> .
2 <i>washer hooks</i> , for handspikes.	1 <i>elevating screw</i> .
1 <i>axletree</i> ; the <i>arms</i> , the <i>stop</i> .	2 <i>shoulder washers</i> , } for <i>axletree</i> .
2 <i>under straps</i> .	2 <i>linch washers</i> ,
1 <i>axle strap</i> .	2 <i>linch pins</i> .
1 <i>bevel washer</i> , for 6-pdr. <i>axle strap</i> .	
3 <i>axle strap bolts</i> ; 3 <i>nuts</i> .	2 <i>WHEELS</i> .

LIMBER.—*Plate 4*.

The same limber is used for all field carriages.

Wood.

1 <i>axle body</i> .	4 <i>foot board brackets</i> .
2 <i>hounds</i> .	2 <i>foot boards</i> .
1 <i>fork</i> .	1 <i>pole</i> .
1 <i>splinter bar</i> .	1 <i>pole prop</i> .

Iron.

8 <i>screws</i> , for foot board brackets.	2 <i>bolts</i> , for splinter bar and fork.
20 <i>nails</i> , for foot boards.	2 <i>nuts</i> , for do.
4 <i>rivets</i> and 4 <i>burr</i> s, for hounds.	1 <i>pole prop socket</i> ; 1 <i>rivet</i> .
4 <i>plates</i> , for stay pins; 8 <i>nails</i> .	1 <i>pole prop ferrule</i> ; 1 <i>rivet</i> .
1 <i>axletree</i> .	1 <i>pole prop chain</i> ; 1 <i>toggle</i> .
1 <i>pin</i> <i>hook</i> .	1 <i>eye pin</i> , for pole prop chain.
3 <i>bolts</i> , for do.; 2 <i>washers</i> ; 3 <i>nuts</i> .	1 <i>burr</i> , for eye pin.
1 <i>stay plate</i> , for limber chest.	2 <i>stay pins</i> , for ammunition chest.
2 <i>nails</i> , for do.	2 <i>keys</i> , for stay pins.
1 <i>pin</i> <i>key</i> .	2 <i>key chains</i> ; 2 <i>eye pins</i> .
1 <i>key chain</i> ; 1 <i>eye pin</i> .	1 <i>rivet</i> and 1 <i>burr</i> , for end of pole.
1 <i>tar bucket hook</i> ; 2 <i>nails</i> .	1 <i>pole bolt</i> ; 2 <i>washers</i> ; 1 <i>nut</i> .
2 <i>bolts</i> , for hounds; 2 <i>washers</i> ; 2 <i>nuts</i> .	1 <i>pole strap</i> and 3 <i>rivets</i> .
2 <i>under straps</i> .	2 <i>pole chains</i> ; the links; the <i>ring</i> .
4 <i>bolts</i> , for under straps; 4 <i>nuts</i> .	1 <i>muff</i> , for pole yoke.
2 <i>axle bands</i> ; 6 <i>nails</i> .	1 <i>collar</i> , for muff; in two parts.
2 <i>end bands</i> , for splinter bar.	2 <i>branches</i> , for pole yoke; 2 <i>rings</i> .
4 <i>rivets</i> , for do.	2 <i>bolts</i> , for collar and branches.
2 <i>bolts</i> , for hounds and splinter bar.	1 <i>washer</i> , for muff; 1 <i>key</i> .
4 <i>washers</i> and 2 <i>nuts</i> , for do.	2 <i>shoulder washers</i> .
1 <i>eye plate</i> , for pole prop socket.	2 <i>linch washers</i> .
2 <i>middle bands</i> , for splinter bar.	2 <i>linch pins</i> .
4 <i>trace hooks</i> .	
1 <i>fork strap</i> .	2 <i>WHEELS</i> , No. 1.
	1 <i>AMMUNITION CHEST</i> .

WHEELS.

There are two Nos. of wheels for field carriages. No. 1, for the 6-pounder gun carriage, the caisson, the forge, the battery wagon, and for the limbers of all field carriages. No. 2, for the 24-pdr. howitzer and the 12-pdr. gun carriages. These wheels are of the same form and height, and they fit on the same axle-tree arm; they differ only in the dimensions of their parts, and consequently in strength and weight.

Wood.

- 1 nave.
- 14 spokes.
- 7 fellies.
- 7 dowels.

Iron.

- 2 brow bands; 2 end bands.
- 12 nails, for bands.
- 1 tire.
- 7 tire bolts; 7 washers; 7 nuts.
- 1 nave box, (CAST IRON.)

AMMUNITION CHEST.—Plate 4.

The same ammunition chest is adapted to the limber and to the caisson.

For the interior arrangement of the chests, for different kinds of ammunition, see CHAPTER XI.

Wood.

- 2 sides.
- 2 ends.
- 1 principal partition.
- 1 bottom.

- 1 frame for cover; 2 sides; 2 ends.
- 1 panel for cover.
- 1 cover lining.

Iron.

- 34 cut nails, for sides, ends and bottom.
- 4 screws, for the bottom.
- 60 copper nails, for cover lining.
- 4 corner plates, for ends and sides.
- 2 do. for ends and bottom.
- 1 do. for side and bottom.
- 96 screws, for corner plates.
- 1 assembling bolt; 1 nut.
- 1 turnbuckle, (BRASS.)
- 1 washer plate, for do.; 2 screws.
- 1 back stay; 6 screws.

- 2 front stays; 4 rivets; 8 screws.
- 2 hinges; 4 rivets; 20 screws.
- 2 hinge plates; 4 screws.
- 1 hasp; 1 rivet; 5 screws.
- 1 hasp plate; 2 screws.
- 2 handles; 8 rivets
- 14 copper washers, for rivets.
- 56 copper tacks, for washers.
- 1 cover, (SHEET COPPER.)
- 216 copper tacks, for cover.

CAISSON.—Plate 4.

Wood.

- 1 middle rail.
- 2 side rails.
- 1 cross bar.
- 1 bolster, for front foot board.

- 1 front foot board.
- 1 rear foot board.
- 1 axle body.
- 1 stock.

SIEGE CARRIAGES.

GUN CARRIAGE.—*Plate 7.*

There are three gun carriages for siege artillery, viz:

One for the 12-pounder gun;

One for the 18-pounder gun;

One for the 24-pounder gun and the 8-inch howitzer.

These carriages are constructed in the same manner, differing only in their dimensions.

When the 8-inch howitzer is mounted on the 24-pounder carriage, a *quin* is used, instead of the elevating screw; the howitzer being too short to rest on the screw.

Wood.

1 stock, in two pieces; 2 dowels.
2 cheeks.

1 axle body.
1 breech bolster.

Iron.

1 assembling bolt; 2 washers; 1 nut.
1 manœuvring bolt; 2 collars.
4 washers and 2 nuts, for do.
6 rondelles, (CAST IRON.)
2 assembling bolts; 4 washers; 2 nuts.
1 lock chain bolt; 2 washers; 1 nut.
1 lock chain and toggle.
1 shoe; 1 key, for shoe.
2 trunnion plates.
2 chin bolts; 2 bevel washers; 2 nuts.
2 key bolts; 2 nuts.
4 cheek bolts; 4 washers; 4 nuts.
2 travelling trunnion bolts.
2 washers; 2 nuts, for do.
2 trunnion plate bolts; 2 nuts.
2 cap squares; 2 eye pins.
2 cap square chains; 2 eye pins.
2 cap square keys.
2 key chains; 2 eye pins.
1 axletree.
2 understraps.
1 axle strap.

2 bolts, for axle strap; 2 nuts.
2 axle bands; 6 nails.
1 lock chain hook; 2 washers; 1 nut.
1 hook, for the shoe.
1 cheek plate, for do.; 3 screws.
1 box, for elevating screw, (BRASS.)
2 bolts, for do.; 2 washers; 2 nuts.
1 elevating screw.
1 strap staple; 1 leather strap and buckle.
2 wheel guard plates; 12 nails.
1 lunette; the rondelle; 3 rivets.
2 lunette bolts; 2 washers; 2 nuts.
1 trail plate; the guard plate; 6 rivets.
29 nails, for trail plate.
2 bolster bolts; 2 washers; 2 nuts.
2 shoulder washers, for axletree.
2 linch washers.
2 linch pins.
2 WHEELS.

WHEEL.

The same wheel is used for all the siege gun carriages and their limbers.

Wood.

1 nave; 14 spokes; 7 fellies; 7 dowels.

Iron.

2 brow bands; 2 end bands; 12 nails; 1 tire; 7 tire bolts; 7 washers; 7 nuts;
1 nave box, (BRASS.)

LIMBER.—Plate 7.

Wood.

1 fork; 2 hounds; 1 splinter bar; 1 pole; 1 leading bar.

Iron.

1 rivet bolt, for fork; 2 washers; 1 nut.	1 bridle, for middle of fork; 4 nails.
1 axletree.	1 rivet, for the pole; 1 burr.
1 pintle plate; 7 nails.	1 eye plate, for pole.
1 sweep bar.	2 pole chains.
2 bolts, for ears of sweep bar.	1 ferrule, for end of pole.
2 washers; 2 nuts, for do.	1 pole clasp; 1 clasp bolt.
1 axle strap.	2 bolts, for eye plate; 3 washers; 2 nuts.
1 lashing chain; 4 rings; 1 hook.	2 bolts, for pole and fork.
6 axle-strap bolts; 2 washers; 6 nuts.	4 washers and 2 nuts, for do.
2 understraps.	1 middle band, for leading bar; 2 rivets.
4 bolts, for do.; 2 washers; 4 nuts.	1 hook, for do.
1 pintle; 1 nut.	1 double trace hook, for middle band.
2 end bands, for splinter bar; 4 rivets.	2 end bands, for leading bar; 4 rivets.
2 middle bands, for do.	2 trace hooks, for end bands.
4 trace hooks, for splinter bar.	2 axle shoulder washers.
1 bridle, for front of fork.	2 linch washers.
2 bolts, for splinter bar and fork.	2 linch pins.
2 nuts, for do.	
2 bolts, for splinter bar and hounds.	2 WHEELS.
4 washers and 2 nuts, for do.	

PENDULUM HAUSSE; or tangent scale.

The *scale* is made of sheet brass No. 13. At the lower end is a brass bulb, filled with lead. The *slider* is of thin brass, and is retained in any desired position on the scale by means of a brass set screw with a milled head. The scale is passed through a slit in a piece of steel, with which it is connected by a brass screw, forming a pivot on which the scale can vibrate laterally; this slit is made long enough to allow the scale to take a vertical position in any ordinary cases of inequality of the ground on which the wheels of the carriage may stand. The ends of this piece of steel form two journals, by means of which the scale is supported on the seat attached to the gun, and is at liberty to vibrate in the direction of the axis of the piece.

The *seat* is of iron, and is fastened to the base of the breech by 3 screws, in such a manner that the centres of the two journal notches shall be at a distance from the axis equal to the radius of the base ring.

A *muzzle sight*, of iron, is screwed into the swell of the muzzle of guns, or into the middle of the muzzle ring of howitzers. The height of this sight is equal to the dispart of the piece, so that a line from the top of the muzzle sight to the pivot of the tangent scale is parallel to the axis of the piece; consequently, the vertical plane of sight passing through the centre line of the scale and the top of the muzzle sight, will be also parallel to the axis, in any position of the piece; the tangent scale will, therefore, always indicate correctly the angle which the plane of sight makes with the axis.

The seat for suspending the hausse on the gun is adapted to each piece, according to the varying inclination of the base of the breech to the axis. The hausse, the seat and the muzzle sight, are marked for the kind of gun to which they belong. The hausse, when not in use, is carried in a leather pouch suspended to a shoulder strap.

The graduations on the scale are the tangents of each quarter of a degree, to a radius equal to the distance between the muzzle sight and the centre of the journal notches, which are, in all cases, one inch in rear of the base ring.

Tangent scales for Pendulum Hausses for field guns and howitzers.

	FOR GUNS.		FOR HOWITZERS.

5°	5.203	6.737	4.650	5.683	6.566	

GUNNER'S PERPENDICULAR. This is made of sheet brass; the lower part is cut in the form of a crescent, the points of which are made of steel; a small spirit level is fastened to one side of the plate, parallel to the line joining the points of the crescent, and a slider is fastened to the same side of the plate, perpendicular to the axis of the level. The instrument is useful in marking the points of sight on siege guns and mortars, when the platform is not perfectly level.

CANNON LOCK. Hidden's patent.

The *seat* is of cast brass; it is attached to the gun, on the left side of the vent, by means of two steel *steady pins* and one *screw pin*, if the gun has no lock piece; a small brass *roller* is set into the rear end of the seat for the lanyard to pass round.

The *hammer* is of brass, with a cone of hardened steel screwed into the head, and fastened by a rivet; the hole for the pin on which the hammer turns is oblong, so that the head of the hammer is drawn back by the same pull of the lanyard which causes it first to strike the primer on the vent.

The *lanyard* is a piece of sash cord .25 in. thick and 6 feet long; one end is secured to the shank of the hammer by a knot; the other end carries an iron *toggle*, which serves for a handle, and also for a wrench to turn the screw pin that fastens the lock to the gun.

For guns that have lock pieces, the seat of the lock is made with a flanch to fit the side of the lock piece, to which it is fastened by two bolts, with thumb nuts.

LOCK COVER. It is made of black bridle or harness leather. The cap which covers the lock is 7 in. long, 3 in. wide, and 3 in. high. Two billets and two

buckle straps, with black buckles, fasten it on the gun; the length of the straps being proportioned to the diameter of the piece.

VENT COVER, for field pieces without locks; (leather) 6 inches long, 4 inches wide, with a *copper pin* riveted to it, 0.175 inch diameter, and 2 inches long—2 *straps*, 1 inch wide, with *buckles*. The length of the strap varies with the size of the piece. In permanent batteries sheet lead may be used for vent covers.

FUZE SETTER; (brass) *the handle*, upper end slightly rounded—the *cup* 2.1 inches diameter; depth 0.3 inch. Whole length 5 to 6 inches.

FUZE MALLET; (dog wood or oak) in one piece; *head* 5.5 inches long, 4 inches diameter—*handle* 7.5 inches long, 1.25 inch diameter.

FUZE SAW; (tenon saw,) 10 inch blade.

FUZE RASP; 12 inch wood rasp.

FUZE AUGER, for boring out the composition to any required depth: *bit* 0.2 inch diameter sliding in a brass *socket* graduated to 10ths of an inch, and held by a thumb screw in the side—*handle*, of hard wood.

FUZE GIMLET; common gimlet 0.2: used for boring across the composition instead of sawing off the fuze.

SHELL-PLUG SCREW; (iron) *stem* 3 inches long, cut with a deep, sharp thread—*eye* 2 inches diameter.

FUZE-PLUG REAMER. A conical steel reamer, for reaming the holes for paper fuzes, in the wooden fuze plugs.

FUZE EXTRACTOR. The inner *screw* and its *stem* are made of steel, and riveted into the *handle*, which is of iron. The stem is contained in a *hollow screw* of steel, which is worked up and down by means of an iron *nut* with *two handles*; the screw being prevented from turning by a slot and a *feather* in the frame; the nut is kept in place by 4 *iron set screws*, the points of which enter into a groove in the nut. The *frame* is of cast brass.

In using this fuze extractor, the inner stem is screwed into the fuze or plug to be extracted, by means of the upper handle, and it is lifted out by turning the nut of the hollow screw.

GUNNER'S PINCERS. Made of iron, with steel jaws 1 inch wide; whole length 10.5 inches.

GUNNER'S CALLIPERS. Made of sheet brass, with steel points. The graduations show the diameters of guns and of shot, linear inches, degrees of the circle, &c.

GUNNER'S QUADRANT; (wood) a graduated *quadrant* of 6 inches radius attached to a rule 23.5 inches long. It has a *plumb line* and *bob*, which are carried, when not in use, in a hole in the end of the rule, covered by a brass plate.

MAUL, for driving pickets; *head* (elm or hickory) 6 inches diameter, 8 inches long—*handle* (ash) $1\frac{1}{2}$ inch diameter, 24 inches long, with an iron band on each end, 1 inch wide, $\frac{1}{4}$ inch thick.

POINTING WIRE, for mortars; (iron wire No. 7) 20 inches long.

QUOIN for siege mortars; (oak) length 19.5 inches; height 7.85 inches; *handle*, 6 inches long.

CHOCK for casemate carriage; small wedge with a handle on one side.

PLUMMET, for mortars—*line* and *bob*.

SCRAPER, for do.; (iron) *handle* 0.5 inch by 0.3 inch square, 27 inches long—one end formed like a *spoon*; the other, a *scraper*.

SPATULA, for mortars; (ash or hickory,) *handle* 16.5 inches long—*blade* 6 inches—*square end* 3 inches long.

SPLINTS; (white pine) 6 inches long, 0.25 inch thick at the large end, 1 inch wide.

WIPER, for the chambers of mortars; tow cloth, 1 yard square.

GUNNER'S SLEEVE, for mortars; (serge or flannel.)

BASKET, for mortar implements— of strong wicker work, 18 inches in diameter, 12 inches deep.

TARPAULINS are made of two sizes: large, 15 feet by 12 feet; small, 5 feet square. For the manner of painting them, see CHAPTER VII.

TOMPIONS, for 8-inch siege howitzers and mortars, and 10-inch mortar.

BROOM, for mortar batteries, (hickory or birch.)

SHELL HOOKS; (iron) 2 *branches* 0.5 inch diameter, in shape of an S, joined by a *rivet*; upper end of the branches connected by 2 *small rings*, 1.25 inch diameter, and 1 *large ring* 3.4 inches diameter: straight *points*, to insert into the ears of the shell 0.5 inch diameter, 0.75 inch long—whole length of branches 12.48 inches.

TOW HOOK; (iron,) *handle* 0.4 inch diameter, 13 inches long; *hook* 1 inch—the other end forms a *hammer* 0.6 inch diameter, 2 inches long.

Used for unpacking ammunition chests.

FUNNEL, for filling shells; (copper or tin,) diameter of *funnel* 3.3 inches—diameter of *pipe* 0.7 inch—length of pipe 2 inches.

POWDER MEASURES. They are made of sheet copper, from No. 16 to No. 20. The bottom is made with a flanch .1 inch deep, turned downwards, and it is brazed or soldered to the sides.

Interior dimensions of cylindrical Powder Measures.

Contents.		Diameter and height.		Contents.		Diameter and height.	
Lbs. oz.		In.		Lbs. oz.		In.	
0	1	1.337		2	0	4.240	
0	2	1.685		2	8	4.571	
0	4	2.122		3	0	4.857

1	4	3.628		6	0	6.120	
1	8	3.855		8	0	6.736	

PROLONGE; 3.5 inch hemp rope of 4 strands; on one end, a *toggle* and 3 *round links* in a *thimble*—on the other end, a *hook* and *thimble*—from the end of the hook to the centre of 1st ring, 31 inches; from centre of 1st to centre of 2d ring, 8 feet; from centre of 2d ring to end of toggle, 16 feet. Whole length of prolonge 26 feet 7 inches—the *toggle* of round iron 0.75 inch diameter, 7.5 inches long, with an eye in the centre—*toggle rings* of 0.5 inch round iron; the ring that enters the thimble is 3 inches, the other two 2.75 inches exterior diameter—*hook* 5.5 inches long; *eye* of 0.5 inch round iron, exterior diameter 2.5 inches; body of hook 0.75 inch diameter, tapering to a point—*thimbles* 1.1 inch interior diameter—*prolonge rings* of 0.6 inch round iron, 4.5 by 3.5 inches; the concave flattened part that is lashed to the rope is 2 inches long, lashed with marline.

SPONGE BUCKET, for field gun carriages. It is made of sheet iron, No. 13; the top and bottom are turned over the sides, and fastened each by *four rivets*. Diameter 7.8 inches; height 9 inches.

The *float* is of wood, fastened by *two rivets* to a cross bar; it is put in before the top is fastened on. The *handle* of the float is fastened to it with *two rivets*, and it is connected with the bail of the bucket by a *chain*. The *bail* is fastened to the bucket by *two ears*, each held by *three rivets*. A *toggle*, which is fastened to the bail by *two links* and a *scivel*, serves to attach the bucket to the eye of the axle strap on the gun carriage.

TAR BUCKET. The bucket is made of sheet iron, No. 13, like the sponge bucket. The *cover* is fastened to the top by a rivet on which it turns, and it is kept closed by shutting over a stud riveted into the top. The *ears* are fastened to the bucket each by *three rivets*; a *ring*, for suspending the bucket on its hook, is connected with the ears by *two chains*. Diameter of bucket 7.2 inches; height 8 inches.

WATER BUCKET, for the travelling forge. The *staves* and the *bottom* are of oak; there are sixteen *staves*, and the *bottom* is made of not more than two pieces. *Three hoops*, made of hoop iron, No. 16; each hoop is joined together with *two rivets*, No. 1, and fastened to the bucket with *two rivets*. *Two ears* let into the sides, and fastened each by *one rivet*. The *bail* has a *link* connected with it by a *swivel*. Diameter at top 11 inches; bottom 10.25 inches; height 11 inches.

WATER BUCKET, for garrison service. It is made in a similar manner with the preceding, except that the *bail* has no *link* and *swivel* attached to it. Diameter at top 10.25 inches; bottom, 13.5 inches; height 11 inches.

WATERING BUCKET, for field service, made of sole leather. The *bottom* is of two thicknesses, fastened to each other with 25 *copper rivets*, and to the sides with 61 *rivets*; the side seams fastened with 28 *rivets*, all 0.5 inch long. A rim of sheet copper, No. 24, is fastened on the upper edge with 14 *copper rivets*; 2 *ears* for the *bail*, fastened each with 4 *rivets*, 0.62 inch long. The *bail* is of round iron 0.5 inch thick. Interior diameter of the bucket at top 12 inches; at bottom, 10 inches; height 9 inches.

SHOVEL—*blade* sheet iron, pointed with steel—length 12 inches; width 10.5 inches—*handle* (ash) 1.5 inch thick at bottom, and 1.25 inch at top; length 45 inches—*ring*, 1.5 inch diameter, secured by a *strap* to the *handle* at 9 inches from the upper end.

PICKAXE; iron, pointed at both ends with steel—length of each *blade* 6.5 inches; width of edge of *axe* 3 inches—*handle* (hickory) about 1.5 inch by 1.25 inch, and 30 inches long.

FELLING AXE—*blade* with steel edge, length 7.25 inches; width of top 3.5 inches, of edge 4.75 inches; thickness at top 0.75 inch, at the eye 1.25 inch; size of the eye 2.25 inches by 0.75 inch—*handle* (hickory) 27 inches long.

HAND BILL, OR BILL HOOK; (iron with steel edges)—*blade*, whole length 8.25 inches; width in the middle 3 inches, near the *shank* 2.7 inches; thickness 0.25 inch—*hook* 1 inch long—*shank* 8 inches long—*handle* (hickory) 7.5 inches long.

DRAG ROPE; 4 inch rope 28 feet long, with a *thimble* worked in a loop at one end, and a *thimble and hook* at the other end—6 *handles*, wood, 12 inches long, 1.5 inch in diameter, fastened in the rope at the distance of 4 feet apart, and at the same distance from the ends of the rope.

MEN'S HARNESS; 4 inch rope 18 feet long, with *thimbles* and a *hook* like the drag rope—instead of *handles*, 10 *loops* made of strips of bag leather 5 feet long, 2.75 inches wide, are fastened to the rope in pairs, each pair being secured in place by two knots worked on the rope; the first pair of loops at 3 feet from the *hook*; the others, at a distance of 3½ feet apart.

SCREW JACK; for field service. The *stand*, (cast iron;) the *hoisting screw*; the *nut*; 2 *handles*; the *cap plate*, fastened on the top of the stand by 4 *screws*. Height of the stand 19 inches; length of screw 15 inches; handles 7.25 inches each.

Preservation and arrangement in Store.

Implements collected together according to kind and calibre, in a dry place, arranged on shelves or racks, in bundles or bunches, or in boxes, according to their nature, with marks and labels showing the kind and number of the articles.

Sponges, rammers, ladles and worms complete, placed on pins in a vertical frame, or suspended vertically or horizontally by racks or hooks, from the joists, supported so as not to bend.—When in separate parts, the *heads* piled on shelves or on the floor, and the *staves* tied up in bundles, according to kind and calibre.

The *woollen sponges* should be preserved from moths by means of camphor, pepper, &c., or by being sealed up in strong paper bags.

Handspikes, in square piles, heads and points alternating.

Leather Equipments—hung on pins or hooks, in dry and cool rooms.

All wood painted, except tool handles—Iron either painted or oiled—See

CHAPTER VII.

Sappers and miner's tools, arranged in piles, the iron coated with varnish—See

CHAPTER VII.

CHAPTER FIFTH.

ARTILLERY HARNESS.—Plate 13.

The construction of the field carriages requires a harness different, in some respects, from that of common wagons. The limber having no sweep bar, the pole is supported directly by the wheel horses, by means of a chain which connects the hames with the pole yoke of the limber; and, in order to diminish the weight at the end of the pole, the leading bars are dispensed with, the traces of the leaders being attached to those of the wheel horses.

The same harness is perfectly adapted also to the siege carriages; but, as these are arranged for draught in the ordinary manner, common wagon harness may be used with them, if necessary.

Black leather is used for the harness, when not otherwise specified; it should be of the best quality, and the strongest leather is selected for the parts which are exposed to the greatest strain, such as traces and breeching. The leather is sewed with strong waxed thread, in double stitch, with about eight stitches to the inch. The seam along an edge is 0.15 inch or 0.2 inch from the edge. The awls should be small for the thread. The ends of the thread should be well fastened before they are cut off.

Straps, or other pieces which have buckles or iron loops attached to them, are generally doubled on a length equal to twice their width, to receive the buckle or loop, which is fastened by two seams. The double end is shaved down.

Standing loops are placed close to the buckles. Their ends are shaved down, brought together, and fastened between the two parts of the strap, if it is doubled.

The tongue holes for buckles are made with a punch corresponding to the size of the tongue. Their distance apart is generally equal to the width of the strap, and the first hole is at double that distance from the end of the strap. This end is shaved down and reduced in width, to facilitate its entrance into the buckle.

The buckles, loops, rings, and hooks are of wrought iron japanned, (black.) The buckles are all made with rollers.

NOTE.—A *layer* is a piece of leather sewed upon another piece, to strengthen it.

A *chape* is a piece used to fasten a buckle or a loop to a strap, or other piece of leather.

A *billet* is a strap which enters a buckle.

A *safe* is a piece of leather placed under a buckle, &c., to prevent it from chafing.

Head Gear.

The head gear is made of strong, black bridle leather, not less than 0.1 inch thick.

HALTER. *One crown piece*, having a billet at each end, for the buckles of the cheek straps.

Two cheek straps. Each of them is sewed to a square *iron loop*, and has at the upper end a *buckle*, with *one standing* and *one sliding loop*.

One brow band, having a loop at each end, through which the crown piece passes.

One nose band, sewed to the same loop as the cheek straps.

Two chin straps. They are doubled, and are sewed to the loops of the cheek straps, and also to another *square iron loop* in rear.

One throat strap. It is made double and sewed to the last mentioned iron loop; its upper end is formed into a loop to receive the throat lash.

One throat lash, with *one buckle*, *one standing* and *one sliding loop* on the left side. It passes through the loops in the brow band and the throat strap.

One chain, (common halter chain.) It consists of about 65 links, No. 1, connected by *two rings* and a *swivel*. It is fastened by a ring to the loop which connects the chin straps of the halter. The other end of the chain has a *toggle* and a *loose ring*, to hitch with. Whole length of chain, $4\frac{1}{2}$ feet.

BRIDLE. *One crown piece.* It is split at each end, so as to form, at one end, *two billets* for the buckles of the cheek straps, and at the other, one billet and one buckle strap, with a *buckle* and a *standing loop* for the *throat lash*.

One brow band, formed into a loop at each end for the crown piece to pass through.

Two cheek straps. Each of them is sewed at the lower end into an *iron loop*, and has at the upper end a *buckle*, with *one standing* and *one sliding loop*, to fasten it to the crown piece. *Two billets* for attaching the bit to the loops of the cheek straps. Each billet has a *buckle* with *one standing* and *one sliding loop*.

Two reins. Each rein is sewed to a *billet*, which has a *buckle*, a *standing* and a *sliding loop*, for attaching it to the bit. The short rein is on the near side, and has a *buckle*, a *standing* and a *sliding loop*, for the billet of the long rein.

THE BIT. It is made of iron, tinned. The *bars* are riveted into the *cheek pieces*. There should be different degrees of severity in the curve of the *port mouth*. The width of the bit, between the cheeks, also varies for three sizes, viz: $4\frac{3}{8}$ inch, 5 inch, and $5\frac{1}{4}$ inch; about three-fifths being of the medium size.

The *curb chain* consists of 19 links, diminishing in size from the middle towards each end. It is attached by an *S* to the right cheek piece, and by a *hook* to the left.

Driver's Saddle.

WOOD. The frame of the tree is made of beech, and consists of the *pommel*, the *cantle*, and *two side bars*, which are notched into the pommel and cantle. The frame is covered with *canvas*, which is glued on and painted.

IRON. *Two pommel plates.* The upper one is fastened by *six rivets* passing through both plates; the lower one by two additional *rivets* in each end, one of which holds one end of the stirrup bar. *One cantle plate*, fastened on the under side of the cantle and the side bars by *ten rivets*.

Two stirrup bars. The front end fastened to the pommel by one of the rivets of the lower pommel plate; the rear end fastened to the side bar by *one rivet*. The *stay* is formed of a piece of iron bent round the stirrup bar, and fastened to the side bar by *one rivet*. There is a roller on each side of the stay, for the stirrup and girth billets to pass over.

Two loops, with rollers; one fastened to the pommel, the other to the cantle, by two of the rivets which hold the plates. The saddle tree is covered with hemp webbing and strong tow linen, stretched on and nailed to the tree.

LEATHER. The *seat* is covered with black upper leather, and stuffed with deer's hair. *Two skirts* are sewed, with welts, to the cover of the seat. *Two iron loops*, for holster straps, are fastened to the front of the saddle by leather loops which pass through slits in the skirts, and are nailed to the tree.

Two inner skirts, or flaps, nailed to the side bars, protect the pad from being chafed by the stirrup and girth leathers. The *pad* is made of russet sheep skin, lined with strong linen, and faced with black sheep skin; it is stuffed with deer's hair, and quilted.

Two iron loops, for cloak straps, are fastened by leather loops, which are nailed to the under side of the cantle.

One billet, for the collar strap, is sewed to the upper loop on the pommel.

Two girth billets, and *two billets* for the trace loops, are sewed on the stirrup bars, behind the middle stay.

Two stirrup leathers pass over the stirrup bars in front of the stay; the *buckle*, with *one standing* and *one sliding loop*, is sewed to the thin end of the strap, which is doubled and stitched, on a length of 8 inches, where it passes through the eye of the stirrup.

The *girth* is of thick black leather. It has a *buckle* and a *standing loop* fastened to each end by a layer.

The pommel and the cantle are plated with *sheet brass*, No. 20, fastened with brass tacks.

Valise Saddle.

WOOD: The frame of the tree is made like that of the driver's saddle, except in its dimensions.

IRON: The *lower pommel plate* is fastened by *ten rivets*, six of which also hold the *upper plate*. These plates have holes in them for the shank of the bridle hook. The hole in the upper plate is square; that in the lower, round.

The *cantle plate* is fastened under the cantle with *eight rivets*.

The *hook* for the reins is fastened to the top of the pommel by a *nut*. The end of the shank should be riveted over the nut.

Two loops, for the collar strap and the crupper, are fastened to the pommel and cantle, as in the driver's saddle. *Four oval rings*, for the valise straps, are fastened by staples which are driven into the tree; two of them in the side bars and two in the cantle.

LEATHER: The *seat* and the *pad* are formed as in the driver's saddle, but the seat is not stuffed. The *skirts* are joined in a similar manner to the cover of the seat.

The *girth* is of leather, and is sewed to the off skirt of the saddle; it has a *buckle* and *two loops*, fastened to it by a layer. A *billet* for the girth is sewed to the near skirt.

Two billets, for the trace loops, pass through the skirts, and are nailed to the side bars.

Two valise straps, each with a *buckle*, a *standing* and a *sliding loop*.

A *billet* for the collar strap is sewed to the iron loop on the pommel.

The *crupper strap* is double. It is sewed to the iron loop on the cantle, and has another *loop*, with a roller, attached to the rear end, for the back strap of the crupper to pass through, so that the same crupper may fit both saddles.

Valise.

The valise is made of black bridle leather, and lined with cotton ticken. The lining is pasted to the inside of the valise; it is sewed round the borders of the outer cover, forming a pocket which has an opening in the middle. The *inner flap* is held down by a *strap* passing through *six staples* of iron wire, No. 12, and fastened by a *buckle* and *loop*; a strip of leather is stitched over the inner ends of the staples.

The ends of the valise are double.

The *cover* is fastened down by *three billets* and *three buckle straps* and *loops*. The *handles* are of leather, rounded and sewed into the ends. *Two loops*, 1 inch wide, for the valise straps to pass through, are sewed to the bottom of the valise.

Whip.

The *stock* is of hickory or of raw hide, about 30 inches long. It is covered with braided leather. A *loop* for the hand is fastened to the butt of the whip.

The leather should be well fastened together at the small end. A *lash* of thread is tied on, and not plaited in with the leather.

Leg Guard.

The *body* is made of stout kip leather; *two layers* are stitched to the upper and lower parts. The *under strap*, to pass under the foot, is sewed to the bottom. *Four leg straps*, each with a *buckle* and a *loop*, are fastened to the body of the leg guard, under the plate. The billet ends of these straps pass through slits in the body.

The *plate* is of iron 0.1 inch thick, and is fastened to the body with *five rivets*.

Nose Bag.

The *bottom* is made of stiff leather, 6 inches diameter and 4 inches deep, to which a bag of strong linen is sewed. Width of bag at the top, 15 inches; whole height, 15 inches. The head strap, 1 inch wide, has a buckle strap 6 inches long, and a billet 34 inches long, sewed to the bag.

Draught Harness.

THE COLLAR. The *rim* is made of bridle leather, and stuffed with uncut rye straw. The *belly*, made of upper leather, in two pieces, is stuffed with straw cut into pieces not longer than $\frac{1}{4}$ inch. The collars are of 2 sizes, 17 and 20 inches; they are made open at the top, and the size is further varied by *two buckle straps* and *two billets* sewed to the open ends. A *pad*, made of black sheep skin, stuffed with deer's hair, protects the neck of the horse from being chafed by these straps.

THE HAMES are made of iron, and painted black. The *branches* have studs forged on them to receive the bolts of the *joint loops* for the trace tugs; these loops turn freely on the bolts. *Two links*, for supporting the breast strap, are welded into the eyes of the bolts.

Two rings, for the trussing straps, are welded into the rectangular eyes at the upper ends of the branches. The branches are joined together, at the lower ends, by a *clasp* which is made fast to the off branch. The *chain* and *toggle*, for connecting the pole yoke with the hames, are fastened to the hames clasp.

Two leather safes are sewed round the branches, under the joint loops, to protect the collar from being chafed by the trace tugs.

Two trace tugs, made of four layers of leather, 0.63 inch thick, are stitched into the joint loops and into *two loop rings* through which the traces pass.

Two trussing straps, each with *one buckle*, *one standing*, and *one sliding loop*, pass through the rings in the upper ends of the hames. They are used for trussing up the harness.

One hames strap, with a *buckle* and *two loops*, connects the two branches together at the top.

One collar strap, having *one buckle* and *one loop*, passes round the hames strap, and is buckled to the billet on the pommel of the saddle, to keep the collar in place.

THE TRACES, for the wheel and the leading harness, are alike, except in the length of the leather part.

The leather trace is made of three layers of leather, making a thickness of 0.63 inch. An *iron loop* is fastened to each end with *three rivets*, 0.25 inch thick.

The trace chains are made of iron 0.3 inch diameter. The front chain has *five links* and a *toggle*. The rear chain has *fourteen links*, *four rings*, (oval,) and a *toggle*.

Two trace loops. The loop is formed by doubling the leather. It has at the upper end a *buckle* and a *standing loop*, by means of which it is connected with the billet on the saddle. At the lower end of each trace loop is an *iron loop*, to which the belly band is sewed. *The belly band* is made in two parts, one being a billet, and the other having a *buckle* and a *standing loop*.

One loin strap, for supporting the traces. It is the same for the wheel and the leading harness, except in length. A *layer* is sewed under the middle of the wheel loin strap, forming a loop through which the back strap of the crupper passes. Each end of the loin strap is buckled into a *loop*, like those just described, through which the trace passes.

THE CRUPPER. *The dock* is made of a piece of leather, 3.5 inches wide and 14 inches long, which is doubled and rounded, without being stuffed. A *buckle* and a *standing loop* are sewed to each end. *The body* of the crupper is split, at the rear end, into two billets which connect it with the buckles of the dock. At the other end are a *buckle* and *four loops* for the billet of the back strap. A *layer*, 10 inches long, is sewed on the body, leaving an opening for the hip strap to pass through; a short *layer* is inserted under the first, in rear of this opening. *The back strap* is sewed in under the first layer in front of the opening for the hip strap. The back strap, passing through the loop in the middle of the loin strap, and through the iron crupper loop on the saddle, returns to the buckle on the body of the crupper. A *sliding loop* holds the two parts together, near the saddle.

Breeching.

The breech strap is made of thick harness leather. A *layer*, also of stout leather, is stitched on the outside of the strap. A *buckle* and *three standing loops* are fastened, at each end, by both these pieces of leather, which are turned back three or four inches and stitched down. *Two iron loops* are fastened by chapes sewed to the breech strap.

Four tugs, for the hip straps, are fastened to the breech strap; two of them in the buckles, and two in the iron loops. These tugs are made double, and have

each a *buckle* and *three standing loops* attached to them. A *safe* is sewed to the inside of each tug, to prevent it from chafing the horse.

The *hip strap* is made in one piece, split at each end into two billets which buckle into the tugs of the breech strap.

The *breast strap* is made of three layers put together in such a manner as to make the strap 0.63 inch thick in the middle, and 0.5 inch at the ends, where it is buckled to the breech strap. The breast strap is supported by the iron loops on the hames, and by the trace loops attached to the saddle. An *iron loop*, with an eye for the pole chain hook, slides on the middle part of the breast strap; it is covered with leather, to prevent it from chafing the strap.

The *pole chain hook* is like the trace hook of the limber; it is welded into the eye of the sliding loop, and forms a direct connection between the pole and the breeching, independently of the collar and hames.

Harness required for each horse.

CHAPTER SIXTH.

MOUNTAIN ARTILLERY.

The carriage and most of the equipments for mountain service being of a peculiar kind, all the details relative to them are collected, for more convenient reference, in this chapter.

The *ordnance* for mountain service is the light 12-pdr. howitzer, described in CHAPTER I.

The gun carriage is adapted to transportation on a pack horse; but for occasional draught when the roads permit, it is furnished with a thill, which is used with the same saddle that carries the pack.

GUN CARRIAGE.—Plate 14.

WOOD: 1 *stock*, in two pieces; 2 *dowels*; 1 *axletree*.

Iron.

3 assembling bolts; 4 washers; 3 nuts.	1 handspike staple.
2 washer hooks, (drag hooks.)	2 friction plates, for shaft; 4 nails.
2 trunnion plates; 6 nails.	1 box, for elevating screw.
2 bolts, for do.; 2 nuts.	2 bolts, for do.; 2 washers; 2 nuts.
2 chin bolts; 2 nuts.	1 elevating screw.
2 key bolts; 2 nuts.	1 axle skean.
2 cap squares; 2 eye pins.	1 axle bolt; 2 washers; 1 nut.
2 cap square chains; 2 eye pins.	2 rivets, for axle arms; 4 burrs.
2 cap square keys.	2 ferrules, for axle arms; 2 rivets.
2 key chains; 2 eye pins.	2 axle bands; 4 nails.
2 implement hooks.	2 understraps.
2 staples, for straps.	2 lynch pins.
1 lunette; 2 rivets; 6 nails.	
1 trail plate; 6 nails.	2 WHEELS.
1 knee, for trail plate; 2 rivets.	

Wheel.

WOOD: 1 *nave*; 12 *spokes*; 6 *fellies*; 6 *dowels*.

IRON. 4 *nave bands*; 12 *nails*.

1 *tire*; 6 *tire bolts*; 6 *washers*; 6 *nuts*.

1 *nave box*, (BRASS.)

CHAPTER EIGHTH.

SMALL ARMS AND ACCOUTREMENTS.

NOMENCLATURE.

Percussion Musket.—Plate 15.

BARREL. 1st reinforce (from the breech to the corner of the flats and ovals 1.89 in. ;) 2d reinforce (to the lower band, 8.8 in. ;) chase (to the top of the upper band, 28.66 in. ;) muzzle, *bayonet stud*, breech, flats and ovals, cone seat, fence, vent, bore, thread for breech screw, thread for the cone.

BREECH SCREW. Plug, with its thread ; tenon, shoulders, tang, tang screw hole, notch for side screw, chamfer.

TANG SCREW : shoulder.

CONE : screw thread, shoulder, square, cone, vent.

BAYONET. *Blade :* point, face flute, back flutes, edges of back and blade, corners, elbow, neck.—*Socket :* muzzle end, bridge end, bridge, mortice, shoulder for the clasp, stop pin.—*Clasp :* body, studs, bridge, groove, *stop*, *clasp screw*.

LOCK. *Lock plate :* front and rear ends, middle, sides, bolsters, chamfer, convex ; 3 holes, for the pivots of the main spring, and bridle, and for the arbor of the tumbler ; 6 screw holes ; 1 mortise for the sear spring stud.—*Hammer :* body, head, comb, countersink, slit, tumbler hole—*Tumbler :* body, friction shoulder, arbor, square, pivot, hook, half-cock notch, cock notch, screw hole—*Tumbler screw.*—*Bridle :* body, eye, pivot, three holes for the tumbler pivot, sear screw and bridle screw—*Bridle screw.*—*Sear :* body, eye, nose, tang, screw hole, friction shoulder—*Sear screw.*—*Sear spring :* blade (upper and lower branch and elbow,) eye, stud, notch, chamfer, screw hole—*Sear spring screw.*—*Main spring :* blade (upper and lower branch and elbow,) hook, pivot, eye, (rest and point,) chamfer, screw hole.—*Main spring screw.*

TWO SIDE SCREWS.

In all the screws the parts are : the stem, the head, the slit, the thread.

MOUNTINGS. *Upper band :* body, pipe for the rod, back, upper and lower straps, creases, *sight*, groove, tang, hole for the band spring pivot.—*Upper band spring :* stem, wire, shoulder, pivot.—*Middle band :* body, stud, creases, hole

for the swivel rivet.—*Middle band swivel*: wire, eye, holes in the eye, rivet.—*Middle band spring*: stem, wire, shoulder.—*Lower band*: body, tang, creases.—*Lower band spring*: same as middle band spring.—*Side plate*: body, eyes and holes for the side screws.—**GUARD**.—*Guard plate*: body, bolsters, trigger stud, 2 holes for the guard bow, 2 for wood screws, 1 for tang screw, 1 for trigger-screw.—*Guard bow*: body, pillars, stems with their screw threads, swivel stud and hole; 2 nuts for stems—*Swivel and rivet*.—*Trigger*: blade, tang or finger piece, hole for the screw.—*Trigger screw*—*Two wood screws* for guard plate.—*Butt plate*: body, toe, heel, corners, tang, screw holes.—*Two wood screws* for butt plate.

RAMROD.—Stem, head, screw.—*Ramrod spring*: stem, eye, spoon.—*Pin* for rod spring.—*Stop* for rod.

STOCK.—Butt, comb, handle, head, facings, 1st and 2nd reinforce, chase, shoulders for the lower and middle bands; *grooves* for the barrel and ramrod; *beds* for the tang and tenon, lock, side plate, guard plate, nuts of the guard bow and trigger stud, butt plate, rod spring and band springs; *mortices* for the trigger and rod stop; *holes* for the rod, the side screws, tang screw, guard screws, butt plate screws, band springs, and pin for the rod spring.

IMPLEMENTS.—*Screw-driver*, with cone wrench.—*Wiper*—*Ball-screw*—*Spring-vice*.

Materials of which the parts are made.

Steel: Tumbler, sear, lock springs, band springs, ramrod spring, ramrod, blade of the bayonet, screw-driver, wiper, and ball screw.

Brass: Sight.

Wood: Stock (black walnut.)

Iron: Socket of the bayonet, and all the other parts not enumerated under the three preceding heads.

NOTE.—The brass for parts of small arms is composed of 80 copper, 17 zinc, and 3 tin.

Flint Musket.—Pattern of 1840.

(See first edition of Ordnance Manual.)

This arm is like the new percussion musket, except in the parts relating to the mode of priming, viz:

BARREL. Omit *cone seat*, and *cone*.

LOCK. Omit *hammer*.

Add: *Pan* (brass)—*pan screw*—*battery* and *battery screw*—*battery spring* (steel)—*battery spring screw*—*cock*—*upper jaw*—*flint screw*.

Flint Musket.—Pattern of 1822.

Of this kind are most of the muskets in store at the Arsenals, which are now being altered to percussion. The bayonet has no *clasp*.

BARREL: *bayonet stud*.

BREECH SCREW.

TANG SCREW.

BAYONET: blade, socket.

LOCK. {
 Lock plate; 2 side screws.
 Pan; pan screw.
 Battery; battery screw.
 Battery spring.
 Battery spring screw.
 Cock; upper jaw; flint screw.
 Tumbler; tumbler screw.
 Bridle; bridle screw.
 Sear; sear screw.
 Sear spring; sear spring screw.
 Main spring; main spring screws.

TWO SIDE SCREWS.

MOUNTINGS. {
 Upper band; sight.
 Upper band spring.
 Middle band.
 Middle band swivel and rivet.
 Middle band spring.
 Lower band.
 Lower band spring.
 Side plate.
 GUARD: guard plate; guard bow.
 Swivel and rivet.
 Trigger; trigger pin.
 Guard plate screws, (2.)
 Butt plate; 2 butt plate screws.

RAMROD.

STOCK.

IMPLEMENTS.—Screw-driver—Wiper—Ball-screw—Spring-vice.

Materials.

Steel: Face of the battery, lock springs, ramrod, blade of the bayonet, screw-driver, wiper, and ball screw.

Brass: Pan and sight.

Wood: Stock.

Iron: Bayonet socket, back of the battery, and all the other parts not enumerated under the three preceding heads.

Alteration of Flint Muskets to Percussion.

THE BARREL is altered: 1st, by closing the vent in the side, and boring a new vent on the upper part of the barrel; 2nd, by upsetting a *cone seat* in the metal of the barrel, and putting in a *percussion cone*. The screw thread of the cone for altered muskets is a little shorter than that for the new muskets, so that it may not project into the bore.

THE LOCK is altered: 1st, by removing the *cock*, the *battery*, *battery screw*, *battery spring*, and *battery spring screw*; 2nd, by cutting off the *pan*, near the face of the lock plate, filling up the hollow of the remaining part with brass, soldered in, and dressing off the upper surface even with the top of the lock plate; 3d, replacing the *cock* by a *percussion hammer*; 4th, filling up the holes of the battery screw and the battery spring screw with pieces of those screws, rounded on the outer end, and filling the pivot hole of the battery spring with wire.

Percussion Rifle.

BARREL : sight, guide, grooves, bands. Cone. Breech screw; tang screw.	Guard bow swivel and rivet. Trigger; trigger screw. Guard plate screw.
LOCK : lock plate; hammer; tumbler; tumbler screw; bridle; bridle screw; sear; sear screw; sear spring; sear spring screw; main spring; main spring screw.	Butt plate; 2 butt plate screws. Box plate; the lid and the strap joined by a hinge and rivet. Three box plate screws.
TWO SIDE SCREWS.	Box plate spring; screw, for do. Box plate catch; 2 rivets.
MOUNTINGS : upper band, with swivel stud. Upper band swivel, and rivet. Upper band spring. Lower band; lower band spring. Side plate. Guard plate; guard bow and nuts.	RAMROD : rod spring and pin; stop. STOCK : patch box. IMPLEMENTS : screw driver, with cone wrench; wiper; ball screw; spring vice; bullet mould.

Materials.

Steel : Cone, guide, tumbler, sear, lock springs, band springs, rod spring, box spring, ramrod, (except the head,) screw driver, wiper, ball screw. Some of the barrels are also now made of cast steel.

Brass : Sight, bands, guard plate, guard bow, side plate, butt plate, box plate and strap, head of ramrod.

Wood : Stock.

Iron : Parts not enumerated under the preceding heads.

Cavalry Musketoon—Percussion.

BARREL : swivel stud; cone; breech screw; tang screw; swivel.	Guard plate; guard bow, and nuts. Trigger; trigger screw. 2 guard plate screws.
LOCK : same as for rifle.	Butt plate; 2 butt plate screws.
TWO SIDE SCREWS.	RAMROD : head; button.
MOUNTINGS : upper band and sight. Upper band spring. Lower band; swivel bar stud. Swivel bar; ring; screw; nut. Side plate.	RAMROD SWIVEL : 2 side bars; screw; axis. STOCK. IMPLEMENTS , same as for the musket.

Materials.

Steel : Cone, tumbler, sear, lock springs, band spring, ramrod, (except the head,) screw driver, wiper, and ball screw.

Brass : Bands, side plate, guard plate, guard bow, butt plate.

Wood : Stock.

Iron : Head of ramrod and all the other parts not enumerated under the three preceding heads.

Artillery Musketoon—Percussion—Plate 15.

BARREL—Bayonet stud; cone.

Breech screw; tang screw.

LOCK—Same as for rifle.

TWO SIDE SCREWS.

MOUNTINGS: Upper band and sight.

Upper band spring.

Lower band, and swivel stud.

Lower band spring.

Lower band swivel and rivet.

Side plate.

Guard plate; guard bow and nuts.

Trigger; trigger screw.

2 guard plate screws.

Swivel plate and stud; 2 screws.

Swivel and rivet.

Butt plate; 2 butt plate screws.

Ramrod spring, and pin.

Ramrod stop.

STOCK.

IMPLEMENTS, the same as for the musket.

N. B.—The musket bayonet may be used with this arm.

Materials.

Steel: Cone, tumbler, sear, lock springs, band springs, ramrod, screw driver, wiper, and ball screw.

Brass: Sight. **Wood:** Stock. **Iron:** The remaining parts.

Sapper's Musketoon—Percussion.

This arm is the same as the artillery musketoon, with the addition of an upper band stud on the barrel, and a catch stud on the upper band, for the sword bayonet.

SWORD BAYONET: Blade, (steel); gripe and guard, (brass) in one piece; slot for the catch stud; socket for the barrel; clasp and clasp screw, similar to those on the musket bayonet—Scabbard, (leather) with brass band and tip.

Pistol—Percussion—Plate 15.

BARREL: Sight; swivel stud. **Cone.** **BREECH SCREW:** Tang screw.

LOCK: Same parts as for the musket and rifle. **TWO SIDE SCREWS.**

MOUNTINGS: Band and side plate, in one piece—guard plate—guard plate screw—trigger—trigger screw—guard bow—guard bow nuts—butt plate—butt plate screw.

RAMROD: Button—head, riveted on.

RAMROD SWIVEL: Two side bars—1 screw—1 cross bar, riveted into the side bars.

STOCK.

IMPLEMENTS: Screw driver and cone wrench—wiper—ball screw—spring vice—bullet mould.

Materials.

Steel: Cone, tumbler, sear, lock springs, ramrod, (except the head,) screw driver, wiper, and ball screw.

Brass: Sight, band and side plate, guard plate, guard bow, butt plate.

Wood: Stock.

Iron: Head of ramrod and the remaining parts.

The tumbler of the pistol is now made with a safety notch, in place of the half cock notch.

Hall's Carbine—Percussion—Plate 15.

This is a cavalry carbine, which loads at the breech by means of a moveable chamber called the *receiver*.

BARREL: *Ramrod stud, sight, guide.*

TWO SUPPORTERS: Each with 2 holes for supporter screws, 2 holes for side screws, 1 for swivel bar and 1 for chock screws—4 *supporter screws*; the heads are countersunk in the supporters, and they are dressed smooth and flush with the outer face of the supporters, which are permanently connected with the barrel by these screws, and by being soldered in place.

TWO CHOCKS: 2 *chock screws.*

RECEIVER AND LOCK: Bore, shoulder for the chocks, cone seat, vent, slot for the side screw, mortise for the lock, studs for the catch—*Cone—Hammer and tumbler*, in one piece; slit for the link—*tumbler screw—sear and trigger*, in one piece; slot for side screw—*sear screw—sear spring—sear spring screw—link—link screw—main spring—main spring screw—catch—catch screw—catch spring—catch spring screw.*

TWO SIDE SCREWS: One of them is the axis of the receiver; the other passes through the supporters and the butt piece.

BUTT PIECE—Butt piece screw, passing through the supporters and the butt piece.

APRON: Lining of the stock, at the junction of the barrel and receiver—*Stop*, riveted to the apron, for the receiver to rest on. The apron and stop have a screw hole tapped to receive the front guard plate screw.

MOUNTINGS: *Upper band—ramrod spring*, riveted to the upper band—*upper band spring—lower band*, with stud for swivel bar—*swivel bar*; the rear end is a side screw for the supporters—*swivel screw—swivel ring—guard plate*; 2 studs for the catch lever—*guard bow—guard bow nuts—catch lever and pin—three guard plate screws—butt plate—2 butt plate screws.*

RAMROD.

STOCK.

IMPLEMENTS: *Screw driver and cone wrench—wiper—spring vice—bullet mould.*

Materials.

Steel: Chocks; hammer and tumbler; link; sear part of trigger; all the springs; ramrod.

Brass: Sight; bands; guard plate; guard bow; butt plate.

Wood: Stock.

Iron: The remaining parts.

For description of *Hall's Rifle*, (flint lock,) see first edition of Ordnance Manual.

INSPECTION OF SMALL ARMS.

All the materials used in the manufacture of arms must be of the best quality, and they should be tested by the inspectors, according to the methods indicated in CHAPTER XIV.

The wood for gun stocks should be seasoned at least 3 years and kept in a dry place 2 years before being worked; it must be free from knots and sap, and no wood which is *brash* or *light*, (cut from old trees,) or worm eaten, or in any degree decayed, or which is cut across the grain at the handle of the stock, or which is kiln dried, should be used or received.

The following rules for inspection apply more particularly to the percussion musket, when not otherwise stated, but the principles and most of the details of the inspection are the same for all fire arms, whether made at the national armories, or by contract at private establishments.

The attention of the inspecting officers should be directed, as much as possible, to the operations of the workmen in the course of the fabrication of arms.

Each component part is first inspected by itself and afterwards the arm in a finished state.

The materials and the forms and dimensions of all the parts must conform strictly to those of the established patterns; the workmanship and finish must be equal to those of the model arms, and the several parts must be browned, blued, case hardened, or polished as in the standard model.

The forms and dimensions of the parts are verified by means of the following gauges:

List of Verifying Gauges for the Percussion Musket.

Each set of gauges is distinguished by the letter with which it is marked. The pieces of the same set are numbered as in the following list.—In some cases *each groove* of a gauge is numbered; for instance, those of the barrel, rod, and bayonet gauges: these numbers will not be found on the list.

No.	FOR BARRELS.
1	1 Stock gauge for the length of the barrel and rod.
2	1 Groove gauge for the diameters of the barrel.
3	1 Standard plug, } for the calibre of the barrel.
4	1 Limit plug, }
5	1 Taper plug, }
6	1 Tap and die for the barrel and breech screw.
7	1 Standard tap and die for the cone seat and cone.
8	1 Tap gauge for the depth of thread in the cone seat.
9	1 Groove gauge for the finished barrel and breech screw.
10 } 11 }	2 Gauges for the exterior of the cone seat.
12	1 Receiving gauge for the barrel and breech screw.

No.

MUSKET—BARREL—*Continued.*

- 13 1 Gauge for the vent.
 14 1 Receiving gauge for the muzzle.
 15 1 Groove and tap gauge for the cone.

FOR LOCKS.

- 16 1 Pattern for lock plates.
 17 1 Groove gauge for lock plates.
 18 1 Receiving and groove gauge for tumblers.
 19 1 Receiving and groove gauge for bridles.
 20 1 Receiving and groove gauge for sears.
 21 1 Size gauge for the hole in the sear.
 22 1 Groove gauge for hammers.
 23 1 Gauge for the set and length of the hammers.
 24 1 Receiving gauge for hammers.
 25 1 Gauge drift for tumbler holes.
 26 1 Groove gauge for main spings.
 27 1 Groove gauge for sear springs.
 28 1 Groove and tap gauge for the lock screws, and for all the screws except the wood screws.
 29 1 Gauge for depth of tumbler screw hole.
 30 1 Receiving gauge for finished locks.

FOR MOUNTINGS AND OTHER PARTS.

- 31 1 Pattern and receiving gauge for butt plates.
 32 1 Groove gauge for butt plates.
 33 1 Groove gauge for bands.
 34 1 Gauge mandril for lower bands.
 35 1 Gauge mandril for middle bands.
 36 1 Gauge mandril for upper bands.
 37 1 Groove and receiving gauge for guard plate bow and nuts.
 38 1 Tap gauge for tang screw hole, trigger stud, and guard bow nuts.
 39 1 Receiving gauge for guards.
 40 1 Receiving and groove gauge for triggers.
 41 1 Receiving and groove gauge for lower and middle band springs.
 42 1 Receiving and groove gauge for upper band springs.
 43 1 Receiving and groove gauge for side plates.
 44 1 Receiving and groove gauge for rod springs and wire pins.
 45 1 Groove and plug gauge for swivels.
 46 1 Groove gauge for breech plate and guard screws, (wood screws.)
 47 1 Receiving gauge for bayonets.
 48 1 Scabbard gauge for bayonets.
 49 1 Groove gauge for bayonets.
 50 1 Plug for bayonet sockets.
 51 1 Groove and plug for bayonets and socket clasps.
 52 1 Groove and pattern gauge for bayonet necks.
 53 1 Grooved and tapped gauge for rods.
 54 1 Groove gauge and pattern for rod stop.
 55 1 Apparatus for testing lock springs; consisting of a stock, scale beam, and brass pods weighing 10 pounds.
 56 1 Gauge for the angle of the stock, and positions of the bands on the finished musket.

For the repair of the Artillery Musketoon :

The same parts as for the Cavalry Musketoon, with the following exceptions :

Omit: *Swivel bars, rings, and nuts.*

Add: Swivel plate and studs.....	.25
Swivel plate screws.....	.50
Swivels and rivets.....	.50
Lower band springs.....	.20

For the repair of arms in the hands of troops in garrison, take about one-half of the number of parts required for arms in the field.

Spare parts required for repairs, if not obtained from arms that are broken up, are supplied from the armories, on requisitions made in the manner pointed out by the regulations of the Ordnance Department.

Durability and strength of Musket Barrels.

The United States musket barrel being much like the French musket barrel, the following remarks relative to the latter, (extracted from the *Aide Memoire*,) will apply to the former. It is to be observed that the charge of the French musket was formerly 162 grains Troy, priming included, (or 146 grains, exclusive of priming,) and is therefore considerably greater than our present service charge.

The regulation fixing the duration of small arms in the French service at 50 years, is founded on the durability of the barrel, which is the most important part of those arms. Experience has shown that a musket barrel will bear 25,000 discharges without becoming unserviceable, and even in time of war a musket is not fired more than 500 times a year. The wear caused by firing is therefore small, and the principal cause of the rejection of barrels is the diminution of 0.09 inch in the diameter at the breech. With good management and care, that diminution will take place very slowly, and it ought not generally to occur in the space of 50 years.

It has also been ascertained, by direct trials, that the strength of the barrel furnishes every requisite security against the accidents of service and the want of care on the part of the soldier; and that, even after being reduced in diameter 0.09 inch at the breech, it is still perfectly safe against the effect of the charge. In experiments made in 1806, barrels reduced 0.13 inch at the breech, bore a double and triple charge with one ball, or 2 cartridges placed one over the other.

Other trials were made in 1829, at the manufactory of Mutzig, on arms sent there for repairs, which had been a greater or less time in the hands of the troops. They furnished the following results :

1st. When a musket barrel is charged with a single cartridge, placed in any part of it, or with 2 or even with 3 cartridges, inserted regularly, without any

interval between them, there is no danger of bursting; with 4 cartridges inserted regularly over each other, or with 2 or even 3 cartridges placed over each other with slugged balls, (or balls *driven* in, as in a rifle,) there is danger only in case of some defect of fabrication, or some deterioration in the barrel—with more than 4 cartridges inserted regularly one over another, or with 2, 3, and 4 cartridges with intervals between them, it is not safe to fire.

2nd. No danger of bursting is occasioned by leaving a ball screw in the barrel. There may be danger from a plug of wood driven tight into the muzzle, when the barrel has been loaded with 2 cartridges; or from a cork rammed into the barrel to a certain distance from the charge, with another cartridge over it.

Snow, clay, and sand, which may be accidentally introduced into the barrel are not dangerous, if they lie close to the charge; but they are so, when there is a space between them and the charge; in this case sand is the most dangerous, then clay and snow.

Balls or pieces of iron inserted over the charge; were not attended with danger when placed close to the charge, even when their weight amounted to $1\frac{1}{4}$ lb.; but there is danger from a piece of iron 0.5 inch square, weighing $\frac{1}{4}$ lb., if placed 20 inches or more from the breech.

3d. A barrel with a defect which might have escaped the inspector at the armory, bore the explosion of 3 cartridges, regularly inserted. After mutilation, which may have caused a reduction of metal in some parts, it may still be used without danger.

Finally, the diminutions of exterior diameter which may be produced in ordinary service are never sufficient to be dangerous. In these trials, barrels originally 0.272 inch thick at the breech, did not burst when loaded with 2 cartridges, until the thickness was reduced to 0.169 inch, and with one cartridge to 0.091 inch.

SWORDS AND SABRES.

NOMENCLATURE.

Cavalry Sabre.—Plate 15.

BLADE. Shoulder, back, edge, bevel, point, curvature, large groove, small groove; *tang*, riveting.

HILT. *Surmounting* (brass,) notch for the guard, back, rivet cap, hole for the tang of the blade—*gripe*, wooden body, (birch or maple,) leather covering, (calf skin blackened,) wires, (brass,) notch for the guard, ridges, shoulder, hole for the tang of the blade—**GUARD**; *front branch*, hook; *back branch*; *middle branch*; *plate*, mortise for the tang, flange, bead, lip.

SCABBARD. (sheet steel)—*Body*, back, front, sides, holes for the rivets—*Mouth piece*, rim, springs, rivet holes; 2 rivets—2 *Bands*, knob, eye for the ring—2 *Rings*—*Tip*, front branch, back branch.

The same sabre, with gilt mountings, for cavalry officers.

Sabre for Mounted Artillery.—Plate 15.

BLADE. With but one groove.

HILT. *Guard*, one branch terminating in a scroll; the plate has 2 countersinks, one for the gripe, the other for the scabbard.

SCABBARD. *Spring*, fastened to the back by 1 rivet—no mouth piece.

In other respects the nomenclature is the same as that of the cavalry sabre.

The same sabre, with ornamented gilt mountings, for mounted officers of artillery and infantry.

Foot Artillery Sword.—Plate 15.

BLADE. Straight, two edged, narrower nearer the hilt than in the middle—*Body* (or blade proper,) shoulder, shoulder rounding, ridges, point, bevells, edges—*Tang*, its rounding and riveting, three holes for the gripe rivets.

HILT. (brass, in one piece)—*Cross*, knob and panel of the cross, mortise for the tang, gripe, fillet, necks, swell, knob with an *eagle* on each side, bolster and hole for the tang rivet, grooves and ridges, three holes and bolsters for the gripe rivets—3 *Rivets* (iron.)

SCABBARD. (harness leather, jacked, blackened, and varnished,)—*Body*, edges, inner and outer sides—*Mountings* (brass.)—*Ferrule*, stud, bead, cap—*Safes* (buff leather)—4 *Nails* for the ferrule and safes—*Tip*, bead, knob—4 *Nails* for the tip.

Infantry Sword.—Plate 15.

BLADE. (Straight, cut and thrust)—Back, edge, groove, bevel, point.

HILT. *Surmounting* (brass,) notch for the hook of the guard, rivet cap, shoulder for the ferrule, hole for the tang; 2 *ferrules*—*Gripe*, wooden body, hole for the tang—*Covering* (sheet brass,) grooves and ridges.

GUARD, in one piece; *branch*, hook and its shoulder; *plate*, flange, bead; *knob*.

SCABBARD. (Leather)—*Ferrule and hook*, (brass,)—*Tip* (brass,) body, front branch, back branch.

This sword is for the non-commissioned officers of foot troops; a similar one, without the guard *plate* and with a blade 26 inches long, for musicians.

The sword for *officers not mounted* is also of the same pattern, with ornamented gilt mountings and a silver gripe; the inner half of the guard plate is made with a *hinge*.

Principal dimensions and weights of Swords and Sabres.

DIMENSIONS.	Cavalry sabre.	Artillery sabre.	Artillery sword.	Infantry sword.

Weight of the finished blade.....	1 5	1 9	
Weight of the scabbard.....	2 2	10	

PROOF AND INSPECTION OF SWORDS AND SABRES.

1st. The dimensions and form of the *blade* are verified by comparing it with the model, and by applying the appropriate gauges and patterns, for the length, width and thickness at several points, and the curvature, if any.

2nd. The *blade* is then proved as follows:—1st. The point is confined by a staple, and the blade is bent on each of the flat sides over a cylindrical block, the curvature of which is that of a circle 35 inches diameter, the curvature of the part next the tang being reduced by inserting a wedge 0.7 inch thick at the

head and 14 inches long. 2nd. It is struck twice, on each of the flat sides, on a block of oak wood the curvature of which is the same as the above. 3d. It is struck twice on the edge and twice on the back across an oak block 1 foot in diameter. 4th. The point is placed on the floor and the blade bent until it describes an arc having the versed sine indicated in the above table. After these trials the blade is examined to see that it is free from flaws, cracks, or other imperfections, and that it is not *set*, that is to say, does not remain bent.

The blade of the *Artillery sword* is proved by striking each of the sides and edges twice on a flat block of hard oak wood.

The stamp of approval or condemnation is placed on the side of the blade, below the tang.

3d. The form, dimensions and workmanship of the *mountings* are examined and compared with the model. After the blade is mounted, the sword is again examined, and it is struck 4 times on a hard block of wood to test the strength of the mountings. The quality of the brass mountings may be tested by breaking a certain number, not more than 4 in each hundred, which should be taken from the pieces rejected for erroneous dimensions.

4th. The form, workmanship, and finish of the *scabbards* are examined and compared with the model, and their fitting to the blades tested. The sewing of leather scabbards and the fastening of the ferrules and tips will be particularly examined.

Steel scabbards are proved by letting fall on them, from a height of 18 inches, an iron weight of two pounds, 1 inch square at the base: 1st, on one side just above the upper band; 2nd, on the same side, 6 inches from the tip; 3d, on the opposite side, just above the lower band. In this proof the scabbard should not remain indented. The nature of the material (whether iron or steel) may be tested, if there is any doubt, by using nitric acid which will leave a black spot on the steel but not on the iron.

PACKING SWORDS AND SABRES.

Packing boxes for swords and sabres are made on the same principles as those for muskets and other small arms, being furnished with packing boards or partitions made with grooves to receive the scabbards near the hilt and near the point; the swords are placed in their scabbards, with the hilts and points alternately towards each end of the box; except the *Artillery swords*, two of which are placed in the length of the box, their points resting on a packing board in the middle. Number packed in a box:

30 Cavalry sabres.	50 Artillery swords.
50 Artillery sabres.	50 Infantry swords.

CLEANING SWORDS AND SABRES.

The iron and brass parts of swords and sabres are cleaned in the same manner as those of muskets. When the oil on the blade of a sword is dried up, it will leave a spot which may be removed by covering it with oil and rubbing it smartly, after a short time, with a linen rag. When a leather scabbard has become wet, draw the blade and dry the scabbard slowly without heating it; wipe the blade dry and pass an oiled rag over it and the scabbard, before returning the blade. Oil the blades of arms in store, and also the scabbards, especially on the seams.

ACCOUTREMENTS.

Infantry Accoutrements.

CARTRIDGE BOX, (black bridle leather.) Length 7.2 inch; width 1.6 inch; depth in front, 5.8 inch—*inner cover*, (light upper leather,) 4 inches wide, with end pieces sewed to it, so as to cover the ends of the box—*flap*, 8.5 inches wide at bottom, 8 inches at top, with a button hole *strap* sewed near the bottom—*brass button*, riveted to the bottom of the box—*implement pocket* (light upper leather) sewed to the front of the box; 6 inches long, 3.5 inches deep, with a *flap*, *strap*, and *loop*—2 *loops*, on the back of the box, near the top, for the shoulder belt to pass through. 2 *roller buckles* (japanned, black,) for the belt; sewed to the bottom of the box. Two **TINS**, each with *one lower division*, 3 inches by 3.3 inches, open in front, to contain a bundle of 10 cartridges, and 2 *upper divisions*, 2.7 inches deep, one of 2 inches by 1.35 inch for 6 cartridges; the other 1.35 inch square, for 4 cartridges. The edges of the tin are turned over and soldered down, to prevent them from cutting the cartridges. All the tin linings should be made to slide freely in the boxes.

CARTRIDGE BOX PLATE: (brass,) oval, 3.5 inches by 2.2 inches, with the letters U. S. stamped on it—2 *eyes*, of iron wire, for fastening the plate to the flap of the box.

CARTRIDGE BOX BELT: (buff leather,) width, 2.25 inches; length, 55.5 inches, clear of the 2 *billets* for buckles, which are each 4.25 inches long and 0.875 inch wide.

CARTRIDGE BOX BELT PLATE: (brass,) circular, 2.5 inches diameter, stamped with an *Eagle*; 2 *eyes*, of iron wire.

CAP POUCH: (black bridle leather,) length and depth 3 inches; width 1.25 inch—*inner cover*, with end pieces—*flap*, made of the same piece as the back, with a button hole strap at the bottom—*brass button*, riveted under the bottom of the pouch—2 *loops*, sewed to the back, 2.25 inches long, to admit a waist belt,

of 2 inches—*lining*: a strip of sheepskin, with the wool on, 1.5 inch wide, glued with fish glue, and sewed to the back, at the mouth of the pouch.

CONE PICK: (steel wire, No. 18,) 1.5 inch long, with a ring handle 0.5 inch diameter; it is carried in a loop in the inner left hand corner of the cap pouch.

BAYONET SCABBARD: (black bridle leather.) Length, including the ferrule and tip, for the bayonets of the model of 1822, 18 inches; for bayonets of model of 1840, 19.5 inches. *Ferrule and tip*, brass. *Frog*: (buff leather,) sewed to a socket of black leather which is fastened to the top of the scabbard—the frog slides on the waist belt.

WAIST BELT: (buff leather) width 1.5 in.; length 38.5 in.; a *loop* at one end.

WAIST BELT PLATE, (brass) oval, 2.8 in. long by 1.6 in. wide, stamped with the letters U. S. 1 *stud* and 1 *hook* (brass.)

GUN SLING, (russet, bag leather) width 1.25 in.; length 46. in.; 1 *standing and 1 sliding loop*—*hook*, (brass) fastened to the sling with 2 *brass rivets*.

SWORD SHOULDER BELT, for non-commissioned officers—(buff leather)—width 2.3 in.; length of short branch 17 in.; long branch 40 in.—1 *standing loop*, on long branch—*Frog* for sword.

SHOULDER BELT PLATE—like the cartridge box belt plate, except in having 3 *hooks*, instead of eyes.

Rifle Accoutrements.

CARTRIDGE BOX. The leather parts are like those of the infantry cartridge box; length 7.2 in., depth in front 5 inches, width 1.6 in. *Two loops* are placed upright on the back of the box, to receive a 2 in. waist belt. The *tin lining* has 2 lower divisions, each 3.3 in. long by 2.8 in. deep, and 5 upper divisions, 1.35 in. square by 2.1 in. deep.

CARTRIDGE BOX PLATE. Like the infantry waist belt plate, except in having instead of a stud and a hook, 2 *eyes*, to fasten it to the flap of the box.

CAP POUCH.

CONE PICK.

WAIST BELT. 2 in. wide.

WAIST BELT PLATE: like infantry cartridge box plate, with 2 *studs* and a *hook*.

GUN SLING.

SWORD SHOULDER BELT, for non-commissioned officers.

} In other respects the same as for the infantry.

Pouch, (light upper shoe leather,) 7 in. wide at bottom, 6.6 in. at top, 5.5 in. deep, made with *gussets* at the sides and bottom—*partition*—*flap*, 2.7 in. deep, with a *strap* and leather *button* on the front side—2 *loops*, (japanned iron,) 0.9 in. wide and 0.7 in. long, for the belt rings.

FLASK. *Body* (copper bronzed,) length 7 in., greatest width 4 in., thickness 2 in.; diameter at top 1.7 in.—*inner charging tube*, (brass) 0.57 in. diameter, 1 in. long—*outer charging tube* 0.65 in. diameter, 1.75 in. long—*valve and spring*—2 *rings* for belt, (copper.)—Flask holds 8 oz. of powder: maximum charger 100 grains, minimum 75 grains—Weight of flask complete, 13 oz.

FLASK-AND-POUCH BELT, (buff leather,) 1.5 in. wide—*belt*, 26 in. long—2 *straps* at each end, 13.5 in. long, 0.6 in. and 0.9 in. wide, to which the pouch and flask are attached by *brass hooks*, riveted to the straps.

Cavalry Accoutrements.

CARTRIDGE BOX, for carbine or musketoon; like the rifle cartridge box.

PISTOL CARTRIDGE BOX. It is like the carbine cartridge box, except in its dimensions; length 6.2 in., width 1.3 in., height in front 3.5 in.—*inner cover*, 3.5 in. wide—*flap*, 6.6 in. wide at top, 6.8 in. at bottom, 6 in. deep—*Tins*: 2 lower divisions, 2 in. deep, 2.9 in. long, 1.2 wide; 5 upper divisions, 1.2 wide by 1.15 in. long and 1.5 in. deep.

CARTRIDGE BOX PLATE, for carbine or pistol cartridge box; the same as for the rifle.

CAP POUCH, } the same as for the infantry.
CONE PICK, }

SABRE BELT (buff leather)—*Waist belt*, 2 inches wide, 36 in. to 40 in. long—1 *square loop* and 2 *D rings* (brass,) for attaching the slings and shoulder strap—1 *shoulder strap*, 1.125 in. wide, 41 in. long, with 2 *hooks*, brass—2 *sabre slings* 1.125 in. wide; front sling 17 in. long, rear sling 34 in.—4 *studs* for do., brass—1 *sabre hook*, brass wire.

SABRE BELT PLATE—Like the rifle waist belt plate.

SWORD KNOT (buff leather)—*Strap* 1 in. wide, 36 in. long; one end of the strap is fastened to a *tassel* 3 in. long; the other end is passed through the tassel after going round the guard of the sabre, and is fastened by one of the tags of the tassel—1 *sliding loop*

CARBINE SLING, (buff leather.) Length 56 in., width 2.5 in.—1 *buckle* and 1 *tip*, brass—*swivel* and *D* with *roller*, bright iron, 2.62 in. wide—*link* and *hook*, iron—*guard-spring*, steel.

HOLSTERS. *Pipe* (sole leather, black); diameter of cylindrical part 2 in.; length of do. 7.5 in.; width of the mouth, 4.8 in.; depth, 2.2 in.; whole length, 14.5 in.—*pocket*, (light upper leather,) 3.2 in. long, 2.5 in. deep, lined with tin and covered with a *flap*—5 *cylindrical divisions*, diameter 0.6 in., each for one cartridge—1 *centre piece* forming the backs and connecting the two holsters, (bridle leather, black,) length 22 in., width 5.75 in.—2 *straps* 14 in. long, 0.75

wide, with 2 buckles, to attach the holsters to the saddle—2 *surcingle loops*, (light bridle leather, black,) 1.5 in. wide, 3.5 in. long, doubled.

Two holster covers, (black leather;) 10 in. long, 9.5 in. wide over the cartridge-pocket—*straps*, 4 in. long, 1 in. wide, to button on 2 *brass studs* on the holster pipes.

Artillery Accoutrements.

For Mounted Artillery.

SABRE BELT (buff leather) 1.7 in. wide, 36 to 40 in. long—2 *leather loops*, sewed on the outside of the belt for attaching 2 *brass loops* for the slings—2 *sabre slings*, like those on the cavalry sabre belt—4 *studs* for do.—1 *sabre hook*.

SABRE BELT PLATE, (brass,) circular, 1.4 in. diameter, lettered *U. S.*; it slides on the belt and is fastened by a *brass hook* and a *sliding loop*—the plate hooks in a *ring* 1.95 in. exterior diameter, attached to the left side of the belt.

SWORD KNOT. Like that for cavalry.

For Foot Artillery.

SWORD BELT (buff leather) 1.7 in. wide, made in three pieces; *long branch*, 24 in.; *frog piece* 4.5 in.; *short branch*, 4 in.; they are united together by 2 *loops*, brass—*frog*, 3.5 in. deep, 2.5 in. wide at top and 2.3 in. at bottom, suspended to the loops by 2 *stings* 1.3 in. wide and 3.5 in. long.

BELT PLATE, the same as for the sabre belt of mounted artillery.

This belt is also used by the non-commissioned officers of infantry, when armed with the foot artillery sword.

Sapper's Accoutrements.

SWORD BELT, (buff leather,) 2 inches wide, 36 to 40 inches long. **Frog**, sliding on the waist belt; width of the loop for the belt 3 inches; width at the bottom 4 inches.

BELT PLATE, like that for the artillery.

CARTRIDGE BOX AND PLATE,	} the same as for the infantry.
CARTRIDGE BOX BELT AND PLATE,	
CAP POUCH,	
CONE PICK,	

Spare parts required for repair of Side Arms and Accoutrements, for one year, in the field.

For 1000 non-commissioned officers or musicians' swords.

- 100 tips for scabbards.
- 20 ferrules and hooks.
- 40 guard bows.
- 50 belt plates.

For 1000 Infantry accoutrements.

- 50 tips for bayonet scabbards.
- 25 cartridge box plates.
- 50 cartridge box belt plates.
- 100 waist belt plates
- 100 cone picks.

For 1000 Cavalry carbine slings.

- 150 swivels.
- 150 swivel springs.

MATERIALS REQUIRED FOR MAKING ACCOUTREMENTS.

CHAPTER NINTH.

GUNPOWDER.

MATERIALS.

Saltpetre.

Saltpetre, nitre, nitrate of potassa, is composed of 53.45 nitric acid and 46.55 potassa—its specific gravity is 2,090—it melts at 660°, and is decomposed at a red heat—100 parts of water, at the temperature of 32°, dissolve 13.32 parts of nitre; at 59°, 25.49; at 86°, 45.90; at 104°, 63.80; at 140°, 110.70; at 176°, 170.80; at 212°, 246.15. Saltpetre crystallizes generally in six-sided prisms, terminated by six-sided pyramids, or in needles deeply striated—its taste is cool, saline, and slightly bitter—when thrown on burning charcoal it melts and deflagrates violently.

Saltpetre occurs naturally in great quantities, on the surface of the earth in India and other warm countries, and in the limestone caves of Virginia, Georgia, Tennessee and Kentucky; in the last named State, it is also found in the form of what is termed *rock ore*, being sand stone containing a very large proportion of nitre. This salt is formed spontaneously by the decomposition of animal and vegetable substances in moist situations, and on this principle artificial nitre beds are made for its production. Saltpetre obtained from any of these sources may be separated from the greater part of the foreign salts and earthy matter by lixiviation with wood ashes and evaporation. The nitrous earth of India yields about one-fifth of its weight of nitre; that of the nitre caves, from one to ten pounds of nitre to the bushel, and the rock ore as much as 20 or 30 pounds to the bushel. The best artificial nitre beds afford annually about a quarter of a pound of nitre to a bushel of earth. Nearly all the saltpetre used in the United States, for the manufacture of gunpowder, is obtained from India, whence it is imported in a crystalized state, called *grough saltpetre*, containing generally from 6 to 12 per cent. of foreign salts, earths, and water.

TEST OF GROUGH SALTPETRE: To a pound of grough saltpetre add a pint of water, saturated with pure saltpetre; stir the mixture for ten minutes with a glass rod, and decant the liquor on a filter; wash the saltpetre a second time in

the same manner, with half a pint of the saturated solution, and pour the whole on the filter ; let it drain, and then dry it perfectly by placing it first on a bed of some absorbent matter, such as ashes or lime, and then by evaporation in a glass vessel over a gentle fire. The saturated solution having taken up only the foreign salts, what remains on the filter, (allowing 2 per cent. for earthy matter and the saltpetre left by the saturated water,) is the quantity of pure saltpetre contained in the pound of grough. As the changes of temperature during the operation may affect the quantity of pure saltpetre remaining on the filter, it is proper to perform a corresponding operation, at the same time and under the same circumstances, on a like quantity of pure saltpetre ; the gain or loss thus ascertained will show the correction to be made in the former result.

Refining Saltpetre.

Saltpetre to be used in the manufacture of gunpowder requires to be freed from the impurities present in its crude state. This may be done by boiling it in pure water and filtering the liquor through canvass bags. The method of refining on a large scale, at the refinery of Paris, is as follows :

FIRST WASHING.—This first operation is performed on 11,660 lbs. of grough saltpetre, containing about 6 per cent. of foreign salts and 6 per cent. of water and earthy matters. This is washed with 4,400 lbs. of water saturated with pure saltpetre, obtained in previous operations ; if that is not at hand, pure water may be used : stir it well, and at the end of 12 hours rake up the saltpetre towards one side of the vessel, and let the water run off at the opposite side, carrying with it the foreign salts ; this is afterwards treated as mother water. After this washing the saltpetre contains only 1 per cent. of foreign matter, and the quantity is reduced to 11,000 lbs.

MELTING. In a boiler of the capacity of about 900 gallons, dissolve 10,000 lbs. of the saltpetre from the first washing in 300 gallons of water, at a moderate heat, putting in first three-fourths of the saltpetre with a proportional quantity of water, and adding the rest in three successive parts. Prepare a solution of 36 oz. of glue in $4\frac{1}{2}$ gallons of water, and when ebullition is about to commence in the boiler, pour in three-fourths of the solution of glue diluted with twice its bulk of water, and skim carefully ; then add 22 gallons of water, in order to diminish the density of the liquid, and to allow the foreign salts and earthy matters to pass through it, and settle at the bottom, or to rise in scum ; this is called a *washing*. Throw into the boiler one-third of the remainder of the saltpetre and the rest of the glue diluted with four gallons of water ; skim for about one hour—make a second washing, and about two hours after, a third—continue

the skimming and evaporation, increasing the heat, until there remains in the boiler but one part of water to four of saltpetre—let the liquor stand for some hours, keeping up a sufficient heat to prevent crystallization, and then draw it off into the crystallizing vat.

CRYSTALLIZATION. The liquor is kept in constant agitation by means of rakes, to prevent the formation of large crystals. Draw off the mother water when its temperature is reduced to 104°, and let the saltpetre drain for some hours.

WATERING. When taken from the crystallizer the saltpetre contains not more than 1-500th of foreign salts; it is put into boxes capable of containing about 4,800 lbs.; on each of these boxes pour, with watering pots, 220 gallons of water, one-third at a time—the two first waterings are allowed to remain on the saltpetre two hours before being drawn off through openings in the bottom of the box; the third merely passes through the saltpetre.

DRYING. After these waterings the saltpetre contains but 1-18000th of hydrochlorates. It is left to drain several days, and then dried in drying vats at a low heat, being constantly stirred.

PACKING. If designed for transportation, the saltpetre when thoroughly dried, being then perfectly white and in small grains, is passed through a sieve of fine wire gauze and packed in barrels. A 100 lbs. powder cask will hold about 132 lbs. of saltpetre.

Saltpetre is also well preserved in cakes, which are made by fuzing the refined saltpetre in iron pots, and casting it into moulds of convenient size; the cakes are 12 in. square and 6 in. thick, weighing about 70 lbs.; six are packed in a box 12.75 in. × 12.75 in. × 38 in.; gross weight 465 lbs. This method of treating saltpetre has the advantage of expelling from it the water of crystallization; but it requires a little more work to pulverize the saltpetre afterwards, in making powder.

The mother water, as it issues from the crystallizer, is received in basins where it cools and deposits saltpetre, which is added to that which has undergone the first washing in another operation; the rest is evaporated to obtain grough saltpetre.

The water used for watering the refined saltpetre is kept to make the first washing of the grough saltpetre, or else it is added to the mother water.

The scum which is obtained in melting is called *foul scum*. Put about 4,400 lbs. of it into a boiler with 265 gallons of water; heat it gradually until it begins to boil; skim and allow it to settle; then draw off the liquor which, in cooling, will deposit grough saltpetre. On the residuum, whilst still hot, pour about 250 gallons of water and add the *second scum*, so as to fill the boiler; after this

has been boiled, skimmed, and allowed to settle, draw off the clear liquor and add it to the mother water. Add the last scum and the dregs to the materials for lixiviation.

Thus, 11,660 lbs. of grough saltpetre furnish 8,000 lbs. of pure, dry saltpetre, besides, 200 lbs. remaining in the scum, 1,200 lbs. in the mother water, and 1,000 lbs. in the washings, which are obtained in the subsequent operations; in all, 10,400 lbs. of pure saltpetre.

TEST OF REFINED SALTPETRE. In order to be used in the manufacture of gunpowder, saltpetre should not contain more than 1-3000th of chlorides.—To test this, dissolve 200 grains of saltpetre in the least possible quantity (say 1000 grains) of tepid distilled water; pour on it 20 grains of a solution of nitrate of silver containing 10 grains of the nitrate to 1033 grains of water, that being the quantity required to decompose 200-3000ths of a grain of muriate of soda; filter the liquid and divide it into two portions—to one portion, add a few drops of the solution of nitrate of silver; if it remains clear, the saltpetre does not contain more than 1-3000th of muriate of soda—to the other portion, add a small quantity of solution of muriate of soda; if it becomes clouded, the saltpetre contains less than 1-3000th. By using the test liquor in very small quantities, the exact proportion of muriate of soda may be ascertained; at the refinery of Paris it does not exceed 1-18000th of the saltpetre, and this degree of purity is attained also at the refinery of Messrs. Dupont. Saltpetre for the best sporting powder is refined a second time, and contains not more than 1-60000th part of chlorides.

Charcoal.

Charcoal obtained from light woods is the best for the manufacture of gunpowder, being more easy to pulverize. *Willow* and *poplar* are used for this purpose in the United States.

The wood must be sound, and should not be of more than 3 or 4 years growth, and about 1 inch in diameter; branches larger than that should be split up. It is cut in the spring, when the sap runs freely, and is immediately stripped of its bark. The smaller branches are used for fine sporting powder.

The operation of charring may be performed in pits, but the method now almost universally pursued in making charcoal for gunpowder is that of *distillation*. For this purpose the wood is placed in an iron vessel, generally of a cylindrical form, to which a cover is luted; an opening, with a pipe, is made to convey off the gaseous and liquid products, and the wood is thus exposed to the heat of a furnace.

The charcoal thus obtained should retain a certain degree of elasticity, and should have a *brown* color, the wood not being entirely decomposed; it retains

the fibrous appearance of the wood, and the fracture is iridescent. As it readily absorbs 1-20th of its weight of moisture, it should be made only in proportion as it is required for use. Wood contains generally about 52 per cent. of carbon, but distillation furnishes not more than 30 to 40 per cent. of charcoal.

The specific gravity of charcoal triturated under heavy rollers is about 1,380; but in sticks, as it comes from the charring cylinders, it rarely exceeds 300.

Sulphur.

Pure sulphur is of a citron yellow color and shining fracture; it crackles when pressed in the hand. The specific gravity of native sulphur is 2,033; that of sulphur refined by sublimation 1,900; its specific gravity is diminished by trituration. Sulphur melts at 220°, but at 320° it takes the consistency of paste; it sublimes at 680°. It is insoluble in water, but soluble in oils and in alcohol.

Sulphur is generally found in great quantities in the neighborhood of volcanoes; it may also be obtained from metallic ores (pyrites) and other sources. Most of that used in the United States is obtained from the French refineries.

Crude sulphur, as extracted by the first sublimation from the ore, contains about 8 per cent. of earthy matter. It is purified by a second sublimation, from which it is collected in the form of powder, called *flowers of sulphur*, or it is melted and run into moulds, making *roll brimstone*. It may also be refined, but not so thoroughly, by being simply melted and skimmed.

Pure sulphur is entirely consumed in combustion, and its purity is thus easily tested by burning about 100 grains in a glass vessel; the residuum should not exceed a small fraction of a grain.

MANUFACTURE OF GUNPOWDER.

Proportions of Ingredients.

		Saltpetre.	Charcoal.	Sulphur.

It appears from experiments that the simple incorporation of the materials makes a powder which gives nearly as high ranges with the cannon as grained powder; the incorporated dust from the rolling barrel may therefore be used in case of necessity. Gunpowder burns at the temperature of 575° to 600° Fahr.

DENSITY OF GUNPOWDER.

The density of gunpowder may be approximately determined by taking the weight of a given quantity; this is called the *gravimetric density*, and the measure used for the purpose a *gravimeter*. The gravimetric density may be expressed by the weight of a cubic foot in ounces, and a convenient form for the gravimeter is a brass cylindrical measure, 4 inches in diameter and 5.093 inches in height, containing 64 cubic inches, or 1-27th of a cubic foot. The weight of the contents should be ascertained with the powder loose and shaken; the difference gives an indication of the relative irregularity and size of grain.

The gravimetric density of unglazed powder (French) made in pounding mills, is about 840. The following results were obtained from some of the best powder made in cylinder mills:

SIZE OF GRAIN.	Specific gravity.	No. of grains of powder in 10 grs. Troy.	Weight of 1 cubic foot.		Cubic inches in 1 lb. loose
			Loose.	Shaken.	
			oz.	oz.	
U. S. { Cannon	1,912	150	929	1,039	30.
U. S. { Musket	4,983	1,100	896	1,012	30.8
U. S. { Rifle	6,000	900	1,060	30.7
U. S. { Sporting.....	2,012	73,000	1,047	1,197	26.5
English—Cannon.....	1,970	174	874	993	31.6

The specific gravities stated in the above table were obtained by means of alcohol; the results are not perfectly accurate, as the method is liable to some objections. The following method of ascertaining the specific gravity of gunpowder is pursued in the French manufactories, but it is also not free from objections. The specific gravity of the sporting powder of the above table obtained by this method is 1,890, and that obtained approximately, by direct measurement and weight of pieces of dried mill cake, is about 1,920.

Determination of the Specific Gravity of Gunpowder.

The instrument used for this purpose is a cylindrical glass vessel of uniform diameter, the edges of which are well ground, and to which is adapted a cover of polished glass accurately ground on the surface, so as to close the vessel her-

metrically. The diameter of the vessel is 3 in., and its weight 4.5 in. With a good balance take the exact weight of the vessel and cover.—Fill the vessel with distilled water and cover it so as entirely to exclude the air; this may be effected by pouring in the water until it runs over the sides of the vessel, and then sliding the cover on—wipe the vessel and the cover perfectly dry, without disturbing the cover so as to admit air in the vessel.—Ascertain the weight of the vessel thus filled, and deducting its weight when empty, set down the weight of distilled water which it contains, which weight we will designate by W . Now wipe the vessel and cover perfectly dry, and ascertain in the same manner the weight W' , which the vessel will contain of water saturated with nitre, such as is used in testing the parity of saltpetre—pour out three-fourths of the saturated solution, and having weighed 1500 grains of powder free from dust, pour it *slowly* into the saturated solution, so that the air between the grains of powder may escape—then fill the vessel with the solution, and cover it as before; wipe it dry and ascertain the weight. From the weight thus found, subtract that of the vessel and cover, and that of the powder; the remainder will be the weight of the saturated solution in the vessel; deduct this weight from that W' , of the saturated solution, before obtained, and the difference will be the weight w' , of the quantity of the solution which occupies the same space as the given quantity of powder. Then $W' : W :: w' : w$, the weight of distilled water which would have been displaced by the powder; and this weight is to that of the powder as the specific gravity of distilled water is to the specific gravity of the powder. Repeat the operation three times, and take the mean result.

Alcohol may be used in the same manner, instead of saltpetre water.

PACKING POWDER.

Government powder is packed in barrels of 100 lbs. each. Powder barrels are made of well seasoned white oak, and hooped with hickory or cedar hoops which should be deprived of their bark; the cedar is not so liable as hickory or white oak to be attacked by worms, and it should therefore be used in preference, or the hoops may be prepared by immersion in a solution of corrosive sublimate. The hoops should cover two-thirds of the barrel. The diameter of the bung-hole is 1.25 in.—Instead of a bung on the side, a screw hole 1.5 inch in diameter is sometimes made in the head of the barrel; it is closed by a wood screw with an octagonal head which must not project beyond the ends of the staves; under the head of the screw is a washer of thin leather steeped in a solution of beeswax in spirits of turpentine. This screw plug renders it unnecessary to take out the head of the barrel, and the hoops may therefore be secured with copper nails; for transportation, a piece of cloth should be glued

over the head of the plug.—Some barrels have been made with six copper hoops, and others with 4 copper and 8 or 10 cedar hoops; the copper hoops are 1 in. wide, and $\frac{1}{8}$ of an inch thick, fastened with two rivets, and nailed each with 3 copper nails, 0.625 in. long—Average weight of a hoop $2\frac{1}{4}$ lbs.

In 1836, some barrels were made water proof by a lining of India rubber cloth, to ascertain its efficiency in preserving the powder in damp situations, or in the exposure of service in the field. This lining appears to have had an injurious effect on the powder, when exposed to heat and moisture, in consequence of the affinity of the caoutchouc for sulphur.

Dimensions of Powder Barrels.

Whole length	20.5 inches
Length, interior, in the clear.....	18 "
Interior diameter at the head.....	14 "
Interior diameter at the bilge.....	16 "
Thickness of the staves and heads	0.5 "
Weight of the barrel with cedar hoops.....	25 lbs.

The barrels have generally 12 hoops, 14 to 16 staves, and 2 or 3 pieces in each head. The above dimensions are calculated so that, with 100 lbs. of powder, there shall be a vacant space in the barrel, allowing the powder to shake, in order to prevent its caking—the barrel would contain about 120 lbs. of powder, settled by shaking.

INSPECTION AND PROOF OF POWDER.

Gunpowder should be of an even grain, angular and irregular in form; it should be so hard as not to be easily crushed by pressure with the finger; it should, when new, leave no trace of dust when poured on the back of the hand, and should leave no beads or foulness when flashed, in quantities of 10 grains, on a copper plate. The size of the grain for each kind of powder is tested in the following manner:

There are three sieves or gauges for each size of grain, made by piercing round holes in thin sheets of brass. The sizes of these holes are as follows:

	CANNON.			MUSKET.			RIFLE.		
	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.	No. 6.	No. 6.	No. 7.	No. 8.
	In.	In.	In.	In.	In.	In.	In.	In.	In.
Maximum.	0.100	0.06	0.035
Medium...	0.085	0.05	0.03
Minimum.	0.070	0.035	0.025

Cannon powder, sifted through the gauges Nos. 1, 2, and 3, should leave not more than 6 per cent. on No. 1; not more than 20 per cent. should pass through No. 3; and of the remainder, not more than one-half should pass through No. 2. This would give about 150 grains of powder in a weight of 10 grs. troy.

Musket powder should all pass through No. 4; about one-half should pass through No. 5; and nearly one-fourth through No. 6. This would give about 2,000 or 2,500 grains of powder in 10 grs. troy.

Rifle powder should all pass through No. 6; not more than one-fifth through No. 8; and not more than two-fifths through No. 7. This would give about 12,000 or 15,000 grains of powder in 10 grs. troy.

Ordinarily, the uniformity and size of grain will be judged of by mere inspection.

The powder in each barrel is proved. For this purpose a sample of about $3\frac{1}{2}$ oz. is taken from each; this is conveniently done by means of an *extractor*, which is a copper tube about 1 inch interior diameter, and 18 inches long, pointed at the bottom, and having a valve at the lower end, or an opening about 9 inches from that end, by covering which with the hand the powder may be poured out of the mouth of the tube; the sample is put into a tin canister marked with a number, a corresponding one to which is inscribed with chalk on the barrel; from these samples, the charges for the eprouvette are weighed on the proving ground, as they are required.

The platform for the mortar eprouvette should be a block of oak timber firmly established on a foundation of masonry, with which it is connected by strong bolts; to this block the iron bed plate is fixed by the three bolts provided for that purpose, the plate being also let into the wood about 1.5 inch, to avoid bending the bolts. The ground where the balls are to fall should be free from stones and not too hard.

The eprouvettes are provided with 3 service balls and a standard ball, (marked No. 1,) by means of which, and of the standard powder accompanying each eprouvette, the mortar and the service balls should be verified from time to time.

The eprouvette, being washed clean and dried by firing a scaling charge, is placed on its bed, in a vertical position, in which it is supported by a wedge or prop; the vent is stopped with a copper wire having a shoulder to prevent it from projecting into the chamber, and the charge of powder is introduced through a long funnel which is supported on the bottom of the bore, at the mouth of the chamber; the ball is then carefully lowered down by means of a hook, and the mortar placed on its bed, care being taken not to jar it roughly; it is primed with a small strand of quick match, and fired without delay. Two

charges are fired in this way from each sample of powder, and if the ranges differ more than 20 yards, a third charge is fired, and the two nearest ranges are used in obtaining the mean range. The mortar is scraped and wiped after each discharge, and it is washed and dried, as at first, after about 8 shots.

The general mean range of new powder proved at any one time must be not less than 250 yards; but no powder ranging below 225 yards is received. The powder in magazines is considered unserviceable if it does not range over 180 yards.

With the eprouvettes, as adjusted in 1837, good cannon powder ranges from 280 to 300 yards, and small grain powder, from 300 to 320 yards.

INSPECTION REPORT. The report of inspection should show the place and date of fabrication and of proof—the kind of powder and its general qualities; as, hard or soft, round or angular, whether free from dust or not, of uniform or irregular grain—its gravimetric density—the separate ranges and the mean range—the condition of the mortar and the ball—the state of the weather.

MARKS. Each barrel is marked on one head with the place and year of manufacture, and with the kind of grain, *cannon, musket, or rifle*; on the other head, with the year in which it was proved and the proof range, leaving room for subsequent proofs, which are marked in the same manner.

Remarks.

Although the above is the established mode of proof and inspection for Government powder, it cannot be disguised that a very imperfect test of the relative projectile force of gunpowder is thereby afforded. Slight variations in the density of powder, which would but little affect its strength, when fired in large quantities, produce great difference in the proof range; and variations in the size of the grain cause still greater irregularities in the range, the powder being in other respects the same. In general, gunpowder of *small grain* and *low specific gravity* gives the highest range in the eprouvette, whilst recent experiments with the ballistic pendulum have shown that the greatest initial velocity, in a shot from a heavy gun, is produced by powder of *great specific gravity* and of *coarse grain*.

PENDULUM EPROUVETTE. The best mode of testing the projectile force of gunpowder is undoubtedly that of ascertaining its effects when used in the same quantities in which it is to be employed in service. This method has been partially adopted by establishing, at Washington Arsenal, a cannon pendulum and a musket pendulum, which are used for proving samples of powder sent from the manufactories. The apparatus shows the initial velocity of a ball fired from a cannon or a musket.

FLINTS.

The best flints are translucent, with a smooth surface, of a uniform tint of light yellow or brown color, and slightly conchoidal fracture. They are generally obtained from England or France.

The parts of a flint are: the *edge or bevel*, the *back*, the *sides*, the *face*, slightly convex, and the *bed* or lower face, slightly concave; in using the flint, the bevel is placed uppermost. There are three sizes for military service; *musket*, *rifle*, and *pistol*, flints. A good musket flint will last for more than 50 fires. Flints are issued to the troops in the proportion of 1 flint to 20 rounds.

DIMENSIONS.	MUSKET.		RIFLE.		PISTOL.	
	Min.	Max.	Min.	Max.	Min.	Max.
	In.	In.	In.	In.	In.	In.
Whole length.....	1.20	1.50	0.97	1.20	0.93	1.10
Width.....	1.08	1.13	0.79	0.88	0.83	0.92
Thickness at the back.....	0.26	0.33	0.20	0.29	0.21	0.27
Length of the bevel.....	0.39	0.55	0.41	0.71	0.30	0.42

The rifle and the musketoon take the same flint. In the inspection of flints, first verify their dimensions with a gauge, giving the maximum and minimum dimensions; see that the bevel is free from spots and irregularities of surface, that the face and bed are nearly parallel, and have not too great a curvature.

Packing Flints.

Flints are usually packed, for sale, in large casks, or in barrels about the size of powder barrels; the latter will hold about 7,500 musket, 13,700 rifle, and 14,700 pistol flints.

In service, they are packed in boxes of the following dimensions:

KIND OF FLINTS.	Interior dimensions of the box.				Flints in each box.		Total weight of box packed.
	Length.	Width.	Depth.	Cubic contents.	Number.	Weight.	
	In.	In.	In.	In.		Lbs.	
Musket.....	24	11.5	8.75	2,415	5,000	111	129
Rifle.....	24	11.5	4.75	1,311	5,000	66	82
Pistol.....	24	11.5	3.25	897	5,000	42	55

The weights vary according to the kind of flint, the black and inferior kind being the heaviest.

The boxes should be made of pine boards 1 inch thick, planed on both sides, and dovetailed at the corners. The length and width of all flint boxes are the same; the depth only is varied to give the required capacity to boxes for different descriptions of flints. If any parcel of one denomination shall be found larger or smaller than usual, the depth of the boxes should be increased or diminished so as to contain them conveniently. A rope handle (or becket) is to be inserted in each end of the box. In boxing a large parcel, it will not be necessary that the contents of each box should be actually counted, if the flints are nearly uniform in size; after counting out accurately four or five parcels, of 5,000 each, from any cask, let each be separately weighed, and take the mean weight of the counted parcels as the basis for determining the quantity for each box, when taken from the same cask. After the flints are placed in the boxes, all the interstices are to be filled with dry sand, in order to exclude the air from them as much as possible; and for the same purpose, the boxes should be well made, of seasoned wood, and with close joints. Each box should be plainly marked on the end with the number and description of flints contained in it, and with the year in which they were manufactured, if this be known; if not known, then with the year in which they were procured.

Flints should not be placed in the upper stories of a building, but in the basement or cellar where the air is damp and cool.

CARTRIDGES FOR SMALL ARMS.

KIND.	BALLS.		CHARGES OF POWDER.				REMARKS.	
	Diameter.	Number in 1 pound.	Weight.	Number in 1 pound.	Ratio to wgt. of ball.	Blank cart-ridges.		
	In.		Grains			Grains

	Musketoön	0.65	17	75	93	1-5th	75	
	Hall's carbine	0.525	32	75	93	1-3d	60	} Rifle powder.
	Rifle	0.525	32	75	93	1-3d	60	
	Pistol	0.525	32	30	233	1-7th	30	

Buckshot are 0.31 in. in diameter; weight, about 150 or 155 to 1 lb.

Cartridges are made either with *single ball*, *1 ball and 3 buckshot*, or sometimes with *12 buckshot*, and they are designated accordingly.

Making Balls.

TO CAST BALLS. 6 men required to each kettle; 2 to cast the balls, 1 to extract and roll, and 3 to trim them.

TOOLS AND UTENSILS. 1 *iron kettle*, fixed in a furnace as before described—2 *iron ladles*, 0.10 in. thick, 3.5 in. diameter, with a lip on the left side and a handle 18 in. long a little bent—1 *bench*, of 4 in. plank—6 *moulds*, (brass,) with double rows for 6 or 8 balls on each side, or for 8 balls and 15 buckshot; placed on the bench—1 *mallet*—1 *double ball-gauge*; the diameter of one ring is 0.002 in. greater than, that of the other 0.0015 less than, the true calibre of the ball—3 *nippers*; one arm is bent and fixed in the bench, the other is about 5 in. longer and has a wooden handle; the jaws are of steel, two inches wide, tempered and ground sharp; they may be so formed as to cut the gate according to the spherical surface of the ball. Under the jaws of the nippers is a hole in the bench, through which the balls fall into *boxes* placed to receive them—1 *rolling barrel*, 2 feet long and 1 foot diameter, made of hard thick staves, with but little bilge, and hooped with iron; it has a small scuttle in the bilge, with hinges and a hasp and staple; the barrel has a gudgeon in each head, and is turned by a crank in a frame to which a hopper may be attached. Instead of the rolling barrel, 2 strong *canvas bags* may be used; they should be 5 feet long and 16 in. in diameter, suspended horizontally by 4 cords attached to the joists of the building—1 *screen*, (sheet iron,) the holes of which are of the diameter of the largest calibre gauge; it is supported by gudgeons which turn in a frame, or in the tops of two stakes driven in the ground.

CASTING. Weigh the lead; fill the kettle and cover it; as the lead melts add more, until it comes within 3 inches of the edges of the kettle; then cover it with a layer of powdered charcoal 1 in. thick; push the heat until paper in contact with the lead is inflamed by it; this requires from 1 to 2 hours.

Immerse the ladle and fill it about $\frac{3}{4}$ full of lead covered with charcoal, which is kept back by a piece of wood, in running the lead; fill all the moulds on one side, then turn them and fill the other side; the first castings are thrown back into the kettle, being imperfect from the moulds being cold; the diameter of some of the balls is verified from time to time, with the gauges; the moulds must be carefully cleaned when it is perceived that the lead sticks to them, and if any moulds give imperfect balls, they must be filled with copper.

Extract the balls and trim them; in cutting, the ball should be gently pressed with the left fore-finger against the nippers, the gate being placed between the jaws.

To SMOOTH THE BALLS. Put 100 lbs. of them into the rolling barrel, and roll them for 3 minutes; or 50 lbs. into a bag and shake it five minutes; then run them through the screen, putting in 50 lbs. at a time; those which remain on the screen are re-cast.

With the above force 30,000 to 35,000 musket balls are made in 11 or 12 hours.

With proper care in observing the instructions, 100 lbs. of lead will give from 96 to 98 lbs. of balls.

PRESSED BALLS. Lead balls are now generally made by compression, by means of machinery; either at the arsenals or at private establishments. These balls are more uniform in size, smoother and more solid than the cast balls. *Compressed buckshot* are also readily obtained from private shot works.

PACKING. Balls are packed in boxes made of 1 in. boards, 9 in. square inside and 5 in. deep, containing 100 lbs. of balls or buckshot; they should be marked on one end with the weight and kind of balls, the place and date of fabrication; the top is fastened with six 2-inch screws, and the boxes must be hooped with iron for transportation.

Making Cartridges.

DIMENSIONS OF PAPER FOR CARTRIDGES.		SHEETS.		TRAPEZOIDS.			
		Length.	Breadth.	Height.	Long side.	Short side.	Number in one sheet.
		In.	In.	In.	In.	In.	
MUSKET.	{ Single ball, or ball and buck-	16.5	13	4.33	5.25	3	12
	shot						
	{ Blank						
RIFLE...	{ 12 buckshot	16.5	13	5.5	5	3	9
	{ Ball						
PISTOL..	{ Blank	20	15	3	4.25	2.25	30
	{ Ball						
	{ Blank	20	15	2.5	4.25	2.25	36

To CUT THE PAPER. 1 Cutter, 1 assistant.

Implements. 1 Cutting board, 30 in. square—1 pattern, of hard wood or iron, of the dimensions of each of the papers—1 rule, of hard wood, 33 in. long,

1.5 in. wide, and 0.5 in. thick, to cut by—2 *laboratory* (shoe) *knives*—2 *sand stones*, for sharpening knives on.

The paper is first cut into strips of a width equal to the length of a trapezoid, and then into trapezoids, by means of the patterns; cut about 12 sheets at a time. A cutting machine, like that used by bookbinders, facilitates the operation, when many hands are employed.

TO MAKE THE CYLINDERS. 1 Master; 10 men to roll the cylinders; 1 to fill them, 4 to fold, 4 to bundle. Boys or girls from 12 to 18 years of age may be advantageously employed.

Implements and utensils, for each workman for making cylinders: 2 *boxes* for the empty cylinders, made of $\frac{1}{2}$ in. boards; interior dimensions, 20 in. long, 8 in. wide, and 5 in. high, without a cover; they are placed upon the sides, facing the front of the cartridge table which is furnished with brackets to receive them, and also with a small enclosure or *locker* for balls, at the right hand of each workman—1 *spool of thread*, turning on a vertical iron spindle fixed in the table near the shot locker; 1 lb. of thread is required for 10,000 single ball musket cartridges, being $8\frac{1}{2}$ inches to a cartridge—1 *choking string*, made by twisting together 4 or 5 cartridge threads; fastened to the edge of the table, at the right hand of the workman—1 *pair of scissors*, to cut the thread—1 *former*, cylindrical, of hard wood, of the same diameter as the ball; one end convex, the other concave, to receive one-third of the ball; length 6 or 7 inches.

Take the paper in the left hand, the former in the right; lay the paper on the table, with the side perpendicular to the bases towards the workman, the broad end to the left; place the former with its convex end at the broad end of the paper; turn it so as to envelop it with the paper, then with the right hand laid flat upon the paper, roll all the paper upon the former; seize it with the left hand, and with the choking string in the right hand, take one turn around the cylinder at about half an inch from the end, to which distance the end of the former is withdrawn; hold the former firmly in the left hand, and draw gently upon the choking string, pressing at the same time, with the left fore-finger, upon the projecting end of the cylinder, thus folding it neatly down upon the end of the former. Having choked the cylinder, carry it to the right side, and with the twine in the right hand, take two turns and a half hitch firmly around the part that has been choked; withdraw the former and introduce the ball, following it to the end of the cylinder with the former reversed; raise the whole again, and with the same thread, (which is never cut until the cartridge is finished,) take two half hitches just upon the upper side of the ball, between it and the concave end of the former. The operation is expedited by rolling the ball placed in the

concave end of the former and choking the paper over it. Cut the thread and place the cartridge in the box which stands fronting the workman.

For ball and buckshot cartridges. Roll and choke the paper, put in 3 buckshot, follow them with the former, and take a half hitch of thread over them; then insert the ball as before.

Buckshot cartridges have 4 tiers of 3 buckshot each, inserted like the first, with a half hitch between them, and finishing with a double hitch.

For rifles, the ball is prepared by being enveloped in a square piece of fine muslin, or of soft thin leather, or of bladder, tied over it and leaving a projecting end about $\frac{1}{2}$ in. long, which, after being trimmed with scissors, is introduced into the paper cylinder which is choked over it and fastened by two turns and a double hitch.

1,000 patches require about 4 yards of muslin.

Cylinders for blank cartridges are made by folding down the paper over the concave end of the charger, touching the fold with a little paste, and pressing it on a ball imbedded in the table for that purpose.

TO FILL THE CYLINDERS. 1 Man to fill, 4 to fold, 4 to bundle.

Implements and utensils. 1 Large copper pan for powder.

1 *Charger* for each kind of cartridge, made of thin copper, with a handle at the top. The chargers are conical:

Dimensions of chargers.	110 grs.	75 grs.	30 grs.
	In.	In.	In.
Diameter { top	0.8	0.7	0.5
{ bottom	0.6	0.5	0.4
Height	1.35	1.25	0.85

1 *Funnel*, copper, of the following interior dimensions:

	In.
Diameter of funnel, { superior	1.75
{ inferior	0.5
Diameter of pipe	0.5
Height of funnel	1.
Length of pipe	1.25

The funnel has a ring handle 0.6 in. diameter.

A charger, for filling cartridges much more expeditiously, is made by attaching to a large brass funnel two charging cylinders which communicate with one

discharging pipe at the lower end. These cylinders are alternately filled and emptied by a reciprocating motion of the funnel pipe.

1 *Folding box* for each calibre, made with only two sides; width equal to 5 times the diameter of the ball, height equal to twice that diameter. Two strips of wood nailed on the table will answer the same purpose more conveniently.

Take the boxes full of cartridge cylinders to the table in the filling room; as they are filled, incline the cylinders over from the empty ones; when all in one box are full, fold the paper down over the powder by two rectangular folds, and place the cartridges before the men who are to bundle them.

BUNDLING. Put a wrapper in the folding box and place in it 2 tiers of 5 cartridges each, parallel to each other and to the short sides of the wrapper, the balls alternating; wrap the cartridges, whilst in the folding box, by folding the paper over them; tie them, first in the direction of the length, then of the breadth, with a bit of twine fastened in a single flat knot.

A package of 12 *percussion caps* is placed in each bundle of 10 cartridges, at the end of the bundle.

The case for the caps is made like a cylinder for a rifle cartridge; it is choked at one end and tied; when the caps are inserted it is folded like a cartridge.

Dimensions of bundles of Percussion Cartridges.

Wrapping paper is but slightly sized, with a view to its being immersed, before using it, in a varnish made of bees-wax, linseed oil and spirits turpentine, for the purpose of making the paper water proof.—See CHAPTER VII.

1000 lbs. of paper require :

Bees-wax.....	133 lbs.,
Spirits of turpentine.....	135 gallons,
Linseed oil.....	10 gallons.

With the above mentioned force, 10,000 musket cartridges are made and bundled in 10 hours, being 1000 for each maker of cylinders.

Packing Cartridges.

Ball cartridges are packed in boxes to contain 1000 each. Blank cartridges may be packed in powder barrels.

Interior dimensions of packing boxes for 1000 Percussion Cartridges.

KIND.	Depth.	Length.	Width.	WEIGHT.	
				Empty.	Packed.

Pistol, ball.....	5.75	13.	8.	7.	45

The boxes are made of 1 in. white pine boards, and are furnished with wooden brackets or handles nailed to the ends; the lids fastened with four 1½ in. screws. They are painted olive color. The kegs or boxes should be lined with strong water proof paper, and the bundles of cartridges must be closely packed, so as not to shake in transportation. Each keg or box should be marked, on both ends, with the number and kind of cartridges; on the inside of the cover, with the place and date of fabrication.

AMMUNITION FOR FIELD SERVICE.—Plate 17.

The charges of powder are contained in *cartridge bags*.

The projectile is attached to a block of wood called a *sabot*.

For the guns and the 12-pounder howitzer, the cartridge and the projectile are attached to the same sabot, making together a *round of fixed ammunition*.

For 32 and 24-pounder howitzers, the projectile is separate from the charge, and the cartridge is attached to a block of wood, called a *cartridge block*.

	Large charge...	-	3.25	2.5	

Cartridge Bags.

The best materials for cartridge bags are wildbore, merino, and bombazette. The stuff should be composed entirely of wool, free from any mixture of thread or cotton, and of sufficiently close texture to prevent the powder from sifting through; that which is not twilled is to be preferred. Flannel is used when the other materials cannot be conveniently obtained.

MAKING CARTRIDGE BAGS. A cartridge bag for field service is made of a rectangle which forms the cylinder, and a circular piece which forms the bottom.

DIMENSIONS.	12-pdr. gun; 32 & 24-pdr. howitzers.	6-pdr. gun, and 12-pdr. howitzer.	REMARKS.
	In.	In.	
Length of rectangle (cylinder developed).....	14.2	11.4	1 in. allowed for seam.
Height.....	10.	7.25	0.5 in. do.
Diameter of bottom.....	5.25	4.37	1 in. do.

The length of the rectangle (development of the cylinder) should be taken in the direction of the length of the stuff, as it does not stretch in that direction.

One hundred 12-pounder cartridge bags require about 27 yards of stuff of single width, (22 inches.)

One hundred 6-pounder bags take about 15 yards.

IMPLEMENTS. *Tables—patterns*, of hard, well seasoned wood, or of sheet iron or tin for the rectangles and bottoms—*scissors—chalk*, or *colored crayons*.

A marker and his assistant spread a piece of stuff on a table, and with the patterns trace out the rectangles and bottoms; a cutter follows and cuts them out with scissors.

Sewing. The bags are sewed with woollen yarn, with 12 stitches to an inch; they are stitched within half an inch of each edge, and the two edges of the seam are turned down on the same side and basted, to prevent the powder from sifting through; the edges of the bottom are basted down upon the sides. Bags for fixed ammunition are sewed to within 3 in. of the mouth, for 12-pdrs.; to within 2.75 in., for 6-pdrs.; all others, up to the mouth.

Cartridge bags when filled should pass through the small shot gauge of their calibre; those used for patterns should be thus verified. The empty bags should be measured by laying the bag, flattened out, between two marks on a table, showing the width of the pattern bag; a variation of 0.1 in. greater or less is allowed. Reject those sewed with too large stitches.

Bags for immediate use, or for blank cartridges, may be formed by sewing together two rectangular pieces with semicircular ends; the stuff is marked, for cutting and sewing, with stamps of the following dimensions:

		CALIBRES....	12-pdr.	6-pdr.
			In.	In.
Stamps,	{ for cutting,	Width.....	7.6	6.
		Length, including semicircular ends.	10.5	8.5
	{ for sewing,	Width.....	6.6	5.2
		Length, including semicircular ends.	10.	8.

These stamps are made of 1 in. boards of the dimensions of the cutting stamp, with a handle in the middle of one side; to the edges of the board is fastened a strip of tin or copper projecting about $\frac{3}{4}$ in. on the side opposite to the handle; another strip is inserted in like manner in a groove parallel to the edges of the board, at the distance indicated for the sewing stamp; the edges of these strips are made rough, to retain the chalk or paste used for marking.

PACKING. Cartridge bags are preserved from moths by being packed with pounded camphor and black pepper, or dipped in water with arsenic dissolved in it. Or, they may be sealed up, in bundles of 50, in cases made of cartridge paper, carefully closed with strips of thin paper pasted over the seams. Each bundle is marked with the number and kind of bags.

They may be preserved from moisture by being enveloped in water proof paper, as above recommended for cartridges for small arms.

Cartridge Blocks.—Plate 17.

Cartridge blocks are cylinders of wood to which the cartridges of howitzers are attached, to give them a better finish, and to increase the length of the smaller charges, so that they may fill the chamber of the piece, and may be less apt to turn in the bore.

They are made of *poplar*, *linden*, or other soft wood.

DIMENSIONS.	32-PDR. HOWITZER.		24-PDR. HOWITZER.	
	Small charge.	Large charge.	Small charge.	Large charge.
	In.	In.	In.	In.

Width of groove.....				
Depth of groove.....	0.15	0.15	0.15	0.15

Sabots—Plate 17.

Sabots are made of *poplar*, *linden*, or other light, close grained wood; the stuff should be clear of knots and splits, and it must be well seasoned.

Sabots for shot and spherical case, for guns, have *one groove* for attaching the cartridge—those for gun canisters, and for the 12-pdr. howitzer shells, spherical case and canisters, have *two grooves*. These grooves are .3 in. wide and .15 in. deep. The corners of the grooves and bottom are slightly rounded.

Sabots for the 32 and 24-pdr. howitzers have no grooves; they are furnished with *handles*, made of cord about .15 in. thick, passing through two holes in the sabots, .25 in. diameter, and fastened by knots countersunk on the inside.

The dimensions of finished sabots are verified with appropriate gauges.

Straps.

Straps are made of sheet tin; they are cut with shears and straightened with a wooden mallet, upon a block of lead.

For shot, there are two straps crossing at right angles, one passing through a slit in the middle of the other. For shells, there are four straps soldered to a ring of tin, or fastened to it by cutting 4 slits in the ring, into which the upper ends of the strap are hooked and turned down on the inside of the ring.

Strapping Shot and Shells.

UTENSILS AND IMPLEMENTS. 1 bench—2 pans, containing nails 0.55 in. long, with strong flat heads 0.2 in. diameter—boxes and barrels, for straps and sabots—4 hammers, for strapping—1 common hammer—4 punches—shot gauges, of each calibre—1 gauge for each calibre, 0.04 in. greater than the largest shot

gauge, through which the shot should pass after it is strapped—*low* or *rags*, for wiping balls—1 *wheelbarrow*—1 *tarpaulin*, if the shop has not a plank floor.

A helper knocks off the scales from the balls with a hammer, cleans and dries the interior of the shells, if requisite, wipes the balls, and gauges them both before and after they are strapped. The workman inserts the roughest part of the shot in the cavity of the sabot, and strikes a few blows on the bottom of the sabot to make the shot enter; he can tell by the sound if the shot touches the bottom of the cavity; if it does not touch, he tries another sabot. With the edge of the hammer he bends one end of the strap which is not slit into the groove of the sabot, punches and nails it; he fastens the other end in the same manner, cutting off the superfluous length; he then nails the other strap, and with his hammer sets them both in, close to the ball, at the top of the sabot.

The sabots for 32 and 24-pounder field howitzers having no groove, each strap is fastened by one nail on the side and 2 under the bottom of the sabot. Two men can strap, in 10 hours, 130 shot, or 75 shells, cutting the tin from the sheet.

If tin or sheet iron cannot be procured, straps may be made of *strong canvas*, 1 inch wide, sewed at the point of crossing. The part of the ball which is to be inserted in the sabot is dipped in glue; the straps are also glued to the ball; the ends are doubled into the groove and secured by two nails in each end. Another method is to wrap round the ball a band of canvass 1 inch wide, one half of which is glued to the ball, the other to the sabot; or, the shot may be kept in place by merely tying the cartridge bag over the top of it.

Fuze Plugs.—Plate 17.

The fuzes for field shells and spherical case are inserted, at the moment of loading the gun, into wooden *fuze plugs*, previously driven into the shells.

These plugs are made of *beech*, perfectly seasoned and dried, so that they may not shrink after they are driven.

DIMENSIONS.	For 32-pdr. spherical case.	For other shells and spherical case.	REMARKS.
	In.	In.

	{ to burst the shell.....	0 11	0 8	0 5	
	{ to blow out the fuze plug	0 2	0 2	0 1	
	{ for service charge.....	1	0 12	0 7	

MATERIALS. Rifle or musket powder—Fuze plugs.

IMPLEMENTS. 1 Funnel—Powder measures, to hold the required charges—1 small mallet—1 Fuze plug reamer.

The shells having been properly cleaned and dried, and attached to the sabots, pour in the charge of powder; drive in the fuze plug with the mallet, until the top of it is within .1 in. of the surface of the shell; be careful that the plug is not split in driving. Ream out the fuze hole in the plug, with a careful steady hand; if the hole is properly reamed, the fuze will project about .15, when pressed in with the thumb. Stop up the hole in the fuze plug, by inserting a wad of dry tow, which should be pressed in firmly with a round stick.

Spherical Case Shot.

CHARGE.	8-in.	42	32	24	18	12	6
Number of musket balls.....	486	306	225	175	120	78	38
Bursting charge of powder, oz.	15	9	8	6	5	4.5	2.5
Weight of shot loaded....lbs.	59.5	39	30.13	22.75	16.3	11.	5.5

The shot having been cleaned and strapped to the sabot, put in the balls. In order to get in the whole number of balls, it is sometimes necessary, when the shell is nearly full, to push the upper balls aside, with the finger, or with a stick. Pour in the charge of powder, shaking it down among the balls. Insert the fuze plug, ream out the hole and stop it with tow, in the same manner as for common shells.

Canisters.—Plate 17.

A canister for field service consists of a tin cylinder attached to a sabot and filled with cast iron shot. For the dimensions of *Canister Shot*, see CHAP. II.

To form the cylinder, the tin is lapped, from .3 to .5 in. and soldered. The cylinder is fastened to the sabot with 6 or 8 nails .5 in. to .75 in. long. A

plate of rolled iron is placed on the sabot, and the canister is closed with a sheet iron cover; the top of the cylinder is cut into strips .4 in. to .5 in. long, and turned down over the cover.

The tin is .02 in. to .025 in. thick. (Double tin.)

DIMENSIONS OF CANISTERS.	FOR GUNS.		FOR HOWITZERS.		
	12	6	32	24	12
	In.	In.	In.	In.	In.
Length of tin for cylinder, (developed)	14.40	11.5	20.	18.3	14.4
Height of ditto	6.65	5.4	7.1	6.3	5.2
Interior diameter of cylinder	4.45	3.53	6.19	5.63	4.45
Diameter of plates for bottom and cover	4.40	3.48	6.14	5.58	4.40
Thickness of bottom plate	0.25	0.25	0.25	0.25	0.25
Thickness of sheet iron cover	0.07	0.07	0.10	0.10	0.07
Height of finished canister, includ'g sabot	8.	6.75	10.5	9.55	8.75
Number of tiers of shot	4	4	4	4	4
Number of shot in each of 3 lower tiers	7	7	12	12	12
Number of shot in 4th tier	6	6	12	12	12
Whole number of shot	27	27	48	48	48
	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.
Weight of finished canister	14.8	7.32	28.5	21.25	10.8

A variation of 0.05 in. more or less, is allowed in the diameter of the iron bottom.

The exterior diameter of each canister must be verified with the maximum shot gauge of the calibre, and the interior, with a cylinder of a diameter 0.02 in. less than that given in the table, which should enter the canister, otherwise it is rejected.

Before filling the canister, dip the tin cylinder into a lacker of bees-wax dissolved in spirits of turpentine, to prevent it from rusting. Coat the balls and the plates with paint or coal tar.

FILLING CANISTERS. Place the canister upright on a bench; insert the iron bottom and place it flat on the sabot; put in a tier of balls, fill the interstices with dry sifted saw dust, pack it with a pointed stick so that the balls will hold by themselves, and throw out the loose saw dust; place another tier of balls and proceed in the same manner until the canister is filled; cover the upper tier with saw dust; put on the cover and on it place one of the iron bottoms furnished with a handle, and strike it with a small mallet in order to compress the saw dust; then remove this bottom and turn down the slit pieces of the canister over the cover, with a hammer. When the canister is finished, verify its diameter with the maximum shot gauge of the same calibre.

Cylinders and Caps.

For the greater security of field ammunition, the cartridges are covered with paper cylinders and caps. The cap is drawn off at the moment of loading the piece, and in using solid shot it may be placed over the shot, to diminish the windage. A cylinder and a cap are formed together by folding the paper over a former, which allows a lap of about 0.75 inch for pasting. The requisite length for the cylinder is cut off from the smaller end; the rest forms the cap, which is choked at the end from which the cylinder is cut.

DIMENSIONS.		FOR GUNS.		FOR HOWITZERS.		
		12	6	32	24	12
		In.	In.	In.	In.	In.
Paper for a cylinder and a cap.	Length, developed...	14.4	11.6	14.4	14.4	11.6

Cylindrical formers for choking caps.	Length:.....	10.	10.	Same as 12-pdr. gun		Same as 6-pdr. gun
	Diameter.....	4.3	3.3			

The choking former should be bored through the axis with a $\frac{1}{8}$ inch hole, to facilitate drawing off the cap; one end is rounded.

Fixing Ammunition.

IMPLEMENTS AND UTENSILS: *Barrels* for powder—1 funnel—1 set of powder measures—1 straight edge, to strike the measures with—barrels—tubs, formed of barrels sawed in two, or boxes for the cartridge bags—2 tarpaulins—2 benches—12 choking sticks, 6 with holes in them and 6 slit—6 knives—6 handbarrows, with four legs and a box, and tarpaulins to cover them—calibre gauges, for the cartridge bags and for fixed ammunition; they may be made of wood—6 stools—1 wheelbarrow—1 mallet—1 copper chisel—1 copper drift, or a wrench, to open powder barrels.

For dimensions of powder measures, see page 235.

Fixing shot, or spherical case, for field guns. The bags should be filled in the small magazine or filling room, and carried, after being shaken and gauged,

to the finishing room. One of the gaugers takes a filled bag with one hand, squeezing the bag upon the powder; he strikes with the other hand on the top and bottom of the bag, twisting the mouth of the bag down upon the powder at the same time; he then tries it with the small gauge, through which it should pass with not more than 0.25 inch play; should it not do this, the bag is emptied and rejected. These bags, filled and gauged, are placed upright in a tub or box, and carried by the gaugers into the finishing room, where the men are placed in pairs, sitting astride on a bench, facing each other. One of them opens a bag and levels the powder, the other inserts the sabot of a strapped shot square upon the powder and draws up the end of the bag over the shot; the first man passes about 4 feet of twine through the pierced stick, and makes two turns and a double hitch with the end at the top of the sabot; he makes a knot in the end of the twine, inserts it into the slit in the other choking stick, and tightens the double hitch by rolling the twine on the sticks and bearing upon the sabot; he then takes out the end of the twine from the slit, ties it in a hard knot, which he tightens with the assistance of the choking stick, and cuts the twine off near the knot. The second man turns down the mouth of the bag over the sabot and the first makes a similar tie in the groove; he makes another tie below the sabot, the twine being lodged between it and the powder, to prevent the latter from sifting in between the bag and the sabot; he then runs the paper cylinder over the cartridge and sabot, leaving about 2 inches of the end of the cartridge uncovered, and he makes a tie, similar to the others, in the groove of the sabot. He now holds the shot in the left hand and examines it, striking the sabot with the right hand, if necessary, to bring it straight; if the shot is properly fixed, the sabot and the bag will be on the same axis; the seams should be between two straps, and the knots should be neither on the seams nor on the straps.

The assistants pass the cartridges through the large gauge, which is 0.04 inch larger than the large gauge for the shot. If the size is correct, they put on the paper cap, lay the cartridges on their sides in the box of the handbarrow, and carry them to the magazine. Those which will not pass through the gauge are handed back to the fixers, who cut the strings and put them up anew.

Canisters for field guns are fixed in the same manner as shot, except that the first tie is made in the upper groove of the sabot; the cylinder is tied in the lower groove. The caps must be cut somewhat shorter than those for shot cartridges.

For the 12-pdr. field howitzer: The shells, spherical case, and canisters, are fixed in the same manner as the gun canisters.

For the mountain howitzer: The sabots having but one groove, the first tie is omitted, and the cartridge is covered with a cap only.

For the 32-pounder and 24-pounder howitzers: The cartridge is not attached to the projectile. The cartridge block is inserted with the grooved end next to the powder, and a tie made in the groove; the mouth of the bag is then turned down, and another tie is made between the cartridge block and the powder; the superfluous part of the bag is cut off, and the cartridge is covered with its cylinder and cap, as in other cases.

When the shot is attached to the sabot by a single band of canvas, or when it is placed in the sabot without any strap, the cartridge bag is drawn over it and tied on top; for this purpose, the bag should have an additional length of from 2½ to 3 inches.

When sabots cannot be obtained, place upon the powder a layer of tow about 0.2 in. thick, forming a bed for the shot; tie the bag over the shot and around the tow; the bag requires to be 1 inch longer than for strapped shot.

Packing Field Ammunition.

Packing boxes for field ammunition are made of well seasoned stuff, (generally white pine,) 1.25 in. thick, dovetailed at the corners. The top of the box is fastened with six 2 in. screws; the box has two handles of 1½ in. rope, attached to brackets at the ends.

The boxes are painted olive color on the outside, and the kind of ammunition is marked on both ends, in large white letters. The place and date of fabrication are marked on the inside of the cover.

Manner of packing Ammunition Boxes.

FOR GUNS. *Shot, spherical case and canisters, fixed:* Laid in two tiers across the box, the shot or canisters alternating with the cartridges at each side. The shot or canisters of the upper tier rest on those of the lower, and not on the cartridges.

FOR 32-PDR. AND 24-PDR. HOWITZERS. *Shells and spherical case shot*: Placed upright, the balls down, resting on strips of wood about .25 in. thick, placed lengthwise of the box and nailed to the bottom, so as to prevent the fuze plugs from bearing on the bottom of the box. The balls are held down by small strips of wood tacked with sprigs to the sides of the box, over the sabots. The cartridges are laid on top of the sabots.

Canisters are packed in the same manner, omitting the strips of wood in the bottom of the box.

FOR 12-PDR. FIELD AND MOUNTAIN HOWITZERS. *Shells and spherical case shot, fixed*: Placed upright, the balls down, resting on strips of wood, as for the other howitzers.

Canisters are packed in the same manner, resting on the bottom of the box.

In all the boxes, the small stores are placed in the vacant spaces on top of the ammunition.

The fuzes of each color are put up in a bundle, wrapped in water-proof paper of corresponding color, and marked with the time of burning. All the fuzes for a box are put in one parcel, wrapped with water-proof paper, and marked: **FUZES.**

A layer of tow is placed in the bottom of each box, and the whole contents are well packed in tow, filling the box so as to be pressed down by the cover. About 3 lbs. of tow are required for a box.

AMMUNITION FOR SIEGE AND GARRISON SERVICE.

Cartridges.

The ordinary service charge of powder for heavy guns is *one-fourth* the weight of the shot; but the charge varies according to circumstances, from *one-third* the weight of the shot, (for a breaching battery,) to *one-sixth* of that weight, for firing double shot or hot shot, and still less, for ricochet firing. The charges for mortars and howitzers vary according to the required range.

Cartridge bags for siege and garrison service are usually made of woollen stuff. These are cut in two pieces, in the form of a rectangle with semicircular ends, which are sewed together to form the bag, as described in making bags for field service. See page 250, for the manner of making and preserving them.

FOR 32-PDR. AND 24-PDR. HOWITZERS. *Shells and spherical case shot*: Placed upright, the balls down, resting on strips of wood about .25 in. thick, placed lengthwise of the box and nailed to the bottom, so as to prevent the fuze plugs from bearing on the bottom of the box. The balls are held down by small strips of wood tacked with sprigs to the sides of the box, over the sabots. The cartridges are laid on top of the sabots.

Canisters are packed in the same manner, omitting the strips of wood in the bottom of the box.

FOR 12-PDR. FIELD AND MOUNTAIN HOWITZERS. *Shells and spherical case shot, fixed*: Placed upright, the balls down, resting on strips of wood, as for the other howitzers.

Canisters are packed in the same manner, resting on the bottom of the box.

In all the boxes, the small stores are placed in the vacant spaces on top of the ammunition.

The fuzes of each color are put up in a bundle, wrapped in water-proof paper of corresponding color, and marked with the time of burning. All the fuzes for a box are put in one parcel, wrapped with water-proof paper, and marked: **FUZES.**

A layer of tow is placed in the bottom of each box, and the whole contents are well packed in tow, filling the box so as to be pressed down by the cover. About 3 lbs. of tow are required for a box.

PAPER BAGS. Cartridge bags for heavy ordnance may be made entirely of paper. The bottom is circular; one end of the paper forming the cylinder is cut into slips about 1 in. long which are pasted over the paper bottom, on a cylindrical former.

The dimensions of the formers and of the paper are easily obtained from the foregoing table. The formers must be bored through the axis, to facilitate drawing off the bag.

When a paper bag is filled, the open end is folded down about $\frac{3}{4}$ in. wide, and this fold is rolled on itself down to the powder, and the part which projects beyond the cylinder is turned in on the top of it.

These bags are apt to leave paper burning in the gun, for which reason those made of woollen stuff are preferable.

For columbiads and sea-coast howitzers, the cartridge should always occupy the whole length of the chamber; for this purpose, in firing with reduced charges, a *cartridge block* is placed in the bag, over the powder. The length of this block for any charge is easily deduced from the length occupied by 1 lb. of powder, as given in the above table.

For mortars, cartridge bags may be made in the same manner as for guns, their dimensions corresponding to those of the chamber of the mortar. But as the charge is generally poured loose into the chamber, the bag being used only for carrying it to the mortar, a gun cartridge bag of any convenient size may be used for mortar service.

For firing hot shot, cartridge bags are made double, by putting one bag within another; care must be taken that the bags are free from holes.

For ricochet firing or other occasions when very small charges are required, a cartridge bag for a piece of an inferior calibre may be used. Or else, after the charge is poured into the bag, place on it another bag filled with hay, pressing it with the hands to reduce the diameter; after having shaken this bag down and rolled and flattened the empty part of the two bags, tie them with woollen yarn, like a bundle of musket cartridges, placing the knot on top.

For proving ordnance, cartridge bags are made of woollen stuff for small calibres, and of paper for heavy ordnance. They should be of the full diameter of the bore or chamber.

Strapping Shells.

Sabots for shells for heavy guns, howitzers and columbiads, are made of plank.

DIMENSIONS OF SABOTS.	SIEGE AND GARRISON GUNS.					SEA COAST HOWITZERS.		COLUMBIADS.

One of the straps has a slit in the middle for the other strap to pass through. Two rings, or loops of tin, 0.38 inch diameter, are soldered securely to the slit strap of the howitzer and columbiad shells, for the purpose of attaching a handle made of cord 0.15 inch to 0.25 inch thick.

The shells are placed in the sabot, and the straps put on in such a manner that the fuze hole may fall in one of the angles, between two straps, and that the axis of the fuze hole may stand at an angle of about 45° with that of the sabot. The eyes of the shell should not be covered by the straps. The straps are fastened at each end with 2 nails in the side, and 2 in the bottom of the sabot.

In loading the piece, care must be taken to place the fuze hole in the upper part of the bore.

Canisters.

A canister for a siege and garrison gun, is made by turning one end of the tin cylinder over the iron bottom, from 0.25 in. to 0.38 in. wide, according to the calibre; the other end is cut into strips 0.5 in. long, to turn down on the cover when the canister is filled. The cover for these canisters is of sheet iron .1 in. thick; it has a handle 3.75 in. long by 1.75 in. wide, made of iron wire No. 9, fastened to the cover by a strap of sheet iron, 2 in. long 1.75 in. wide, secured by two rivets 0.15 in. thick. The bottom plate is of cast iron, 0.5 in. thick.

For dimensions of *Canister Shot*, see *CHAP. II.*

Canisters for 8-inch siege and sea-coast howitzers, are attached to sabots, of the following dimensions:

The square of the nut is 2 diameters of the pin; its thickness, 1 diameter. The head of the pin is countersunk flush with the bottom of the lower plate, which has a *slot* to prevent the pin from turning when the nut is screwed on. Each plate has on the inside 3 beds for the shot, of a depth equal to half the thickness of the plate; they are made in the form of a spherical segment, the curvature of which is the same as that of the shot; their centres are on equidistant radii, midway between the edge of the pin hole and that of the plate. In the upper plate are 2 holes 0.25 in. diameter, placed opposite to each other at 0.5 in. from the edge of the plate, to receive a rope handle.

For the 8-inch sea-coast howitzer, the stand of grape must be attached to a conical sabot. The sabot is 4.25 in. long, 7.85 in. diameter at the large end, and 6.4 in. at the small end. The sabot may be fastened to the lower plate with screws, or the pin may be made long enough to pass through it; or else the sabot may be inserted into the piece separately from the stand of grape.

Filling Shells for Mortars.

	{ to blow out the fuze.....	0	6	0	5	0	4
Ordinary service charge.	{ Cannon powder.....	7		3		1	12
	{ Incendiary match, or other composition..	0	8	0	6	0	6

1 Man to fill, 1 helper.

MATERIALS. Cannon powder—incendiary match—pieces of fire stone 3 in. long, or other incendiary composition—loaded fuzes—tow.

IMPLEMENTS AND UTENSILS. 1 pair of shell hooks—1 handspike—2 hand hammers—2 scrapers, (pieces of sword blade)—2 tow hooks—2 pairs of pincers—rags—1 chisel and 1 mallet, to clean the shells and break up any hard substance that may be found in the interior—2 searchers, for sounding cavities—shell gauges—1 grate, to dry the shells on—1 fuze saw—1 gimlet—a ring of rope, or a hollow block—1 funnel—powder measures—1 tub, or vessel for powder—2 baskets, for the composition and fuzes—1 rasp—1 fuze setter, and 1 mallet.

TO CHARGE A SHELL. Clean the shell inside and out; gauge it; see that it has no holes or fissures deep enough to cause its rejection; that the fuze hole is well reamed, and that there are no flaws around it on the inside; if the shell is wet, heat it slightly and let it cool slowly.

Cut the fuze to the proper length, according to the range, by resting it in a groove made in the block, the saw running in a cut made for it; or bore the fuze through with a gimlet, perpendicularly to the axis, at the proper length.

Place the shell on the block or ring of rope; pour in the powder and introduce the incendiary composition; try the fuze, which should enter $\frac{3}{4}$ of its length; cover the head of the fuze with tow, and drive it with the fuze setter and mallet, so that the head of the fuze shall project not more than 0.2 in. to 0.4 in.

Shells are generally filled and the fuzes driven in the battery magazines, as they are required.

Charges for Shells for Columbiads and heavy Guns.

CHARGE OF POWDER.	COLUMBIADS.				GUNS.									
	10-in.		8-in.		42		32		24		18		12	
	Lbs.	oz.	Lbs.	oz.	Lbs.	oz.	Lbs.	oz.	Lbs.	oz.	Lbs.	oz.	Lbs.	oz.
To fill the shell - -	3	4	1	12	1	8	1	5	1	0	0	11	0	8
To burst the shell -	1	6	1	0	0	12	0	11	0	8	0	7	0	5
To blow out the fuze plug -	0	10	0	8	0	6	0	2	0	2	0	14	0	1
For ordinary service - -	3	0	1	8	1	4	1	0	0	12	0	10	0	7

The *fuzes* for these shells are made with paper cases, and are inserted at the time of loading the piece.

The *fuze plugs* are made of wood, or of brass, driven or screwed into the fuze hole; they are covered with a cap of peculiar construction which contains the priming of the fuze. The size of the plug is indicated by that of the fuze hole in the shell.

The bursting charge is poured into the shell through the hole in the fuze plug.

Wads.

Wads for proving cannon are made of *junk*.

IMPLEMENTS. 1 *wad mould* with two holes for each calibre; made of cast iron cylinders set in oak, or of two strong pieces of oak strapped with iron and joined by a hinge—1 *drift* for ditto—1 *maul*.

DIMENSIONS OF MOULDS.	10 in.	8 in.	42	32	24	18	12	6

MAKING WADS. The *junk*, after having been picked, is compressed by being beaten in the smaller mould until it assumes the requisite dimensions; it is then taken out, by raising the upper part of the mould, and closely wrapped with rope yarn passed over it in the direction of the axis of the cylinder and fastened by a few turns round the middle of the wad; after which it is placed in the large
